

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

R E P O R T

TO

The Right Honourable Sir GEORGE GREY, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

*General Register Office, Somerset House,
31st May 1865.*

I HAVE the honour to submit to you the detailed abstracts of the marriages, births, and deaths that have been registered in England and Wales during the year 1863.

347,020 persons married, 727,417 children were born alive, and 473,837 persons died. Thus the names of 1,548,274 persons were added during the year to the registers deposited and indexed in the office: it is the greatest number ever recorded in one year, and raises the total number to nearly *thirty-four millions* since the commencement of registration in 1837.

The natural increase of population by the excess of births over deaths was 253,580, or nearly 700 daily. In the middle of 1863 the population

TABLE I.—Estimated Population, with the Number of Marriages, Births, and Deaths registered in England, in each Year from 1838 to 1863.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of the Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS.	EXCESS OF BIRTHS OVER DEATHS.

1863	20,554,137	175,510	347,020	727,417	473,837	253,580

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1831-51; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

of England and Wales probably exceeded *twenty and a half millions*. The number of emigrants who left the ports of the United Kingdom at which Government agents are stationed during the year was 223,758; of whom 67,926 were of English origin, 18,709 of Scotch, 127,920 of Irish, and 9,203 were foreigners; the numbers are corrected proportionally for the 23,061 whose birthplace was not recorded. Of the emigrants 146,813 departed for the United States, 18,083 for the North American colonies, 53,054 for the Australian colonies, and 5808 for other places.

MARRIAGES.

The cloud passing over the cotton manufacturing districts in 1861 and 1862 was reflected at once in the marriage registers, and the rate which in 1860 was as high as 1·710 persons married to every 100 persons living, was reduced to 1·628 in 1861, and further to 1·614 in 1862. In 1863 the crisis had passed: after a bountiful harvest the people began to think more favourably of their prospects, and marriage proceeded at an augmented rate, the proportion to every 100 persons living rising to 1·688, while the average of the last 26 years was 1·640.

The average price of wheat per quarter, which was 55s. 5d. in 1862, had decreased to 46s. 7d. in the March quarter of 1863, and was as low as 40s. 6d. on the average of the last three months of the year. The average number of paupers relieved on the *last day* of each week during the first quarter of 1863 was, in-door 142,257, and out-door 943,324; the numbers falling to 130,072 and 804,940 respectively, in the last quarter of the year. This evidence of the growing prosperity of the people received additional force from the increase in the marriage rate.

Of the 173,510 marriages, the numbers solemnized according to the rites of the Established Church were 136,743; of which 19 were by special licence,

NOTE.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2228 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results.

19,298 by licence, 109,573 by banns, 4,312 by Superintendent Registrar's certificate: in 3,542 instances it was not stated under which of the foregoing headings the marriages should be classed.

36,767 of the marriages were *not* performed according to the rites of the Established Church; 8,095 were among Roman Catholics, 14,714 among members of various Christian denominations, 51 among Quakers, and 318 among Jews; 13,589 were performed at Superintendent Registrars' offices. The marriages among Quakers show an almost yearly decline, while those among the Jews exhibit an increase. Table III. gives, in a comparative statement, the number of marriages under each head since the year 1841, and

Table III^a. shows that of the 36,767 marriages *not* according to the rites of the Established Church, 4,202 were by licence granted by the Superintendent Registrar, and 32,565 by Superintendent Registrar's certificate. The respective numbers in each county are also shown in the Table.

Re-marriages.—23,494 widowers and 15,307 widows re-married during the year ; of the former 15,269 allied themselves to spinsters and 8225 to widows ; the remainder of the widows re-marrying (7082) were espoused by bachelors. 13·5 per cent. of the men who married had been previously married, while among the women who married 8·8 per cent. had been previously wedded. These proportions are below those of any year since 1852. The Tables given at pages 26 and 27 are interesting and worthy of study ; they show the ages and civil condition of the contracting parties.

Minors.—A belief is sometimes expressed that people marry later in life than they did formerly ; but if this is the case in certain classes of society it does not obtain among the people generally, for the proportion of young persons who marry has never been so high as during the year 1863 ; and with very few exceptions the rate has been annually increasing for more than 20 years. In 1841, in every 100 marriages, 4·38 of the men and 13·29 of the women were under 21 years of age ; in 1863 these proportions had risen to 6·61 and 19·90 respectively. The counties in which the greatest proportions of young persons married are Buckinghamshire, Northamptonshire, Huntingdonshire, Bedfordshire, Cambridgeshire, Staffordshire, Leicestershire, West Riding of York, and

Durham. The counties showing the smallest proportions are Middlesex (extra Metropolitan), Herefordshire, Shropshire, Rutlandshire, North Riding of York, Northumberland, and North Wales. The relative tendency, however, to early marriage in different places can only be measured by the proportions which the marriages of minors bear to the numbers living unmarried at corresponding ages.

Signatures of persons married.—132,248 men and 116,094 women wrote their names; 41,262 men and 57,416 women signed the marriage register with marks. *Seventy-six* in 100 men wrote their names and 24 made marks. In 100 women *sixty-seven* wrote their names and 33 made marks. These proportions are precisely the same as in the previous year, and cannot be regarded as satisfactory; the 12 preceding years show a continuous decrease in the percentage of those who signed with marks. London heads the list with proportions of 89 in 100 men and 82 in 100 females signing their names. The extra-metropolitan portions of Surrey,

1851	.858	5.591	.130	.728	38 6

* Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; of these, 135 may be taken to represent the marriages of the higher and middle classes, and 669 those of the classes below.

Kent, and Middlesex also show a large proportion who signed their names, as likewise do Sussex, Hampshire, Devonshire, Gloucestershire, Yorkshire, and the northern counties; in Monmouthshire and Wales the state of education, measured by this standard, is very defective. In England and Wales there were 26,626 instances in which both the bride and bridegroom signed the register with marks; and there were 45,426 alliances where one signed by name and the other signed by mark. Half of the women who married in Wales and Lancashire signed with marks.

Buildings registered for the solemnization of marriages.—During the year 1863 200 additional places of worship were registered for the solemnization of marriages therein, under the Act 6 & 7 Will. 4. c. 85.; of these, 25 belonged to the Independents, 40 to the Baptists, 88 to various denominations of Wesleyan Methodists, 16 to Welsh Calvinistic Methodists, and 15 to Roman Catholics. In 1862 the number of buildings registered was 190. At the close of 1863 there were 4954 buildings on the register, including 1554 belonging to the Independents, 1066 to the Baptists, 1049 to the Wesleyan Methodists, and 587 to the Roman Catholics. The distribution of the registered buildings will be seen in the Table. (See Table VIII.)

The marriages in registered buildings in 1863 were 22,809; in the 337 buildings in London 2369 marriages were solemnized, including 1460 marriages in Roman Catholic chapels; in the 651 buildings in the North-western division (Cheshire and Lancashire) there were 5590 marriages, 3431 of which were celebrated in Roman Catholic chapels. In Monmouthshire and Wales, where the registered buildings are the most numerous, 2760 marriages were celebrated in the 780 chapels, namely 303 of Roman Catholics, and 2457 of other denominations. With regard to marriages in Roman Catholic chapels, it may be remarked that in some instances one of the parties to the marriage is a Protestant. In certain cases couples are married twice and their marriages are twice registered.

* The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

During the year 1863 80 new district churches and chapels-of-ease were licensed for marriages according to the rites of the Established Church.

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 844 marriages took place; of 1,000 men married 762, of 1,000 women 669, signed the marriage register by writing their names; of 10,000 men married 661 were not of full age, of 10,000 women married 1990 were not of full age; of 10,000 men married 1854 were Widowers of the same number of women married 622 were Widows.

BIRTHS.

The names of 727,417 living children were inscribed in the registers of births during the year 1863, a number exceeding by 14,733 those recorded in the previous year, and more than a *quarter of a million* in excess of those registered in 1838, the first complete year of registration. The number of births, as well as the proportion to the population, has never been so high; the average rate of birth is 3.333 to every 100 persons living; it rose to 3.504 in 1862, and still further, to 3.539 in 1863, being one birth to every 28 persons living. As in previous years Durham exhibits the highest birth-rate (4.207 per cent.), and Herefordshire has the minimum rate (2.981 per cent.)

Sex.—372,019 of the births registered were those of male children, and 355,398 those of female children, so there were 104.7 males born to every 100 females born. Cumberland had the unusually high proportion of 112 males, Monmouthshire had 111, Huntingdonshire 110, and Westmorland 109, to 100 females born. In Berkshire, Rutlandshire, and the North Riding of Yorkshire more females than males were born, the respective numbers being 99.7, 99.5, and 99.6 to every 100 females born.

Seasons.—In the first quarter of the year 186,341 births were registered, in the second quarter 189,340, in the third quarter 173,439, and in the last quarter 178,297. If the average number of births in a quarter be represented by 1000, then there were in the first quarter 1039, in the second 1043, in the third 946, and in the last quarter 972.

Children born out of wedlock.—47,141 children, namely, 24,288 boys and 22,853 girls, were born out of wedlock in 1863. The proportion is 6.5 born out of wedlock to 93.5 born in wedlock to every 100 births, or nearly as 1 to 14. The proportionate number is in excess of the two years preceding, when it was 6.3 per cent. The proportion of illegitimate births

* Chiefly belonging to the "United Methodist Free Church."

Shropshire (10·1 per cent.), the whole of the North-midland counties, Cheshire, East and North Ridings of York, Northumberland, Cumberland (with the maximum rate of 12·0 per cent.), Westmorland, and North Wales. A rate of illegitimacy far above the average has, in successive reports, been shown to prevail in certain counties, and it is a matter for surprise that so little attention has been paid to this important subject. Local knowledge and investigation might possibly detect a cause in prevailing social habits; and the cause being ascertained the first step is gained towards an amelioration. A good field is open for inquiry and reform, and he will be a public benefactor who helps to purge his county of this moral stain.

DEATHS.

The deaths in 1863 were 473,837. If the facts are stated roundly, the number exceeded that of the year 1860 by 51,000, that of 1861 by 39,000, and that of 1862 by 37,000. The number of English funerals approached half a million.

The excess of births over deaths was 253,580.

The rate of mortality was 2·305 per cent. against an average rate in 26 years (1838-63) of 2·228. After a period of health embracing three years (1860-2), when the annual mortality was less than 2·2 per cent., and in the first of those years only 2·124, fatal causes began to operate, and the effect was a mortality higher by ·181.

Sex.—The numbers of males and females who died in the year were, respectively, 242,203 and 231,634. The death-rate of males was 2·424 to 100 males living; that of females 2·193 to 100 females living. The averages of 26 years are: 2·314 per cent. for males; 2·145 for females. For every 100 females who died in the year there were 105 deaths of males. But this proportion is derived from the deaths of males and females as they occurred in unequal populations of the sexes, the females living in England being considerably in excess of the males. If a town or province were found in which the two sexes mustered equally strong, the greater mortality of males would give 111 for every 100 deaths that occurred amongst females.

Females suffered less than males from the insalubrious influences peculiar to the year; the female mortality showing a less excess above its average than did the mortality of males.

TABLE IX.—Births in the Years 1845-63 in England, distinguishing the Legitimate and Illegitimate.

1862	712,684	667,402	45,282
1863	727,417	680,276	47,141

Locality.—It has been remarked that the mortality of England was 2·305 per cent. But the death-rates in London and the several counties, of which this is the average, showed many degrees of variation ranging from the lowest in Westmorland, 1·735, to the highest which occurred in Lancashire, and was 2·629. Of the three Yorkshire Ridings the unhealthiest was the West, in which the mortality was 2·573; the next

the East, where it was 2.529; the healthiest the North Riding, where the rate was 2.104. The health of London was less favourable in the three years 1861-3 than it had been in the two previous years; and in 1863 the mortality rose to 2.447, which is higher than it had been in any year since 1854, when cholera raged in the metropolis.

The counties in which the mortality was 1.7 and below 1.9 were Westmorland, Herefordshire, and the extra-metropolitan part of Surrey. In

Dorsetshire the death-rate was 1·981. In Huntingdonshire it was 2·332 ; in Warwickshire 2·307 ; in Staffordshire 2·371 ; in Cheshire 2·396.

In almost all the counties, as well as in London, the mortality was above the average. The following furnish the only exceptions to the rule :—Hampshire, Herefordshire, Staffordshire, Nottinghamshire, Derbyshire, Westmorland, Monmouthshire, and South Wales. Such instances are so few that the causes of the high mortality may be assumed to have

been chiefly zymotic, or in the air and water, for they exercised an influence almost universal. Leicestershire and Gloucestershire suffered remarkably. But in Cornwall the result was extraordinary; with an average mortality of 2·057 per cent., and a mortality varying little from that in the previous nine years, the rate rose in 1863 to 2·532 per cent.

Deaths of males at different ages.—The mortality of boys under five years of age was unusually high; it was 7·743 per cent., the average of 26 years being 7·236. In that series of years there were only seven instances in which the mortality exceeded 7·500; three in which it exceeded the high rate of 7·700. In the next quinquennial period (5–10 years) the mortality 1·031 was also above the average. At that age it is seldom as high as one per cent. In the next three periods, which, except the first, are decennial, extending to 35 years, the death-rate differed little from the average. In 35–45 the mortality was 1·330, and exceeded the average. In the next two decennial periods the rates, 1·729 and 3·055, were below their averages. In 65–75 the rate, 6·924, exceeded the average; in 75–85, 14·084 was less than the average, 14·658; in 85–95 there was 31·245 against 30·368; and at 95 years and upwards the rate rose to 48·848 against 43·770. In each of the three decennial periods, 65–95, the mortality rather more than doubles itself on that of the period immediately preceding. The results thus obtained, together with those derived from a comparison of the facts of 1861, 1862, and 1863, prove that the unhealthy influences of 1863 spent themselves chiefly on children.

Deaths of females at different ages.—In all the periods of life, except those 10–15; 15–25 years, the mortality of females was below that of males. Under five years the mortality of females was 6·715 per cent., being 10 in a thousand less than that of males. The conclusion, drawn above, that

Average of 26 years, 1838–63	2·314	2·145	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·342 deaths of males; to every 100 females living there were 2·146 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females; and that out of equal numbers living the deaths of males were 109 to every 100 deaths of females in 1838.

children were the chief sufferers, appears to be also justified by the mortality of females at the several ages.

Seasons.—In the March quarter there were 128,096 deaths; in that of June 118,121; in the September quarter 112,504; and in the December 115,116. If the deaths in the year had been only 1000, while the same quarterly proportions were maintained, the numbers would have run in

44	North Wales - - -	1.962	2.145	1.894	1.938	2.026	2.047	2.225	2.096	2.189	2.171	2.070

the four seasons as follows: 274, 250, 236, 241. The mortality was high in each quarter. In the first, it was 2·538 per cent. against the average 2·487; in the second 2·308 against 2·221; in the third 2·169 against 2·040; and in the last quarter 2·213 against 2·171.

Meteorology.—The mean temperature of the air at Greenwich in each month till May showed a clear excess above the average. In May, June, and July it was depressed below its average; in August was slightly above it, but again experienced a decided fall in September. In the subsequent three months the air was warm. The mean temperature of the year was 50·3°, or 1° above the average of 22 years. But though the winter, except part of March, was uncommonly mild, it was far from healthy. The rain-fall was 19·8 inches in the year, or 3·8 inches less than the average.

Summary of the Quarterly Reports, 1863.

First Quarter.—January, February, March.

The birth-rate was unusually well maintained last quarter; and it has been high during several successive corresponding quarters. The marriages in the first quarter of the year were more numerous than in the two previous corresponding quarters, a result which the metropolis appears to have mainly helped to produce. In the last Quarterly Report it was shown that the mortality was high; and the returns since obtained furnish equal evidence that in the first quarter of the present year the public health has not improved. The cold weather of November was

* For mode of reading this Table, see Note to Table XVII.

NOTE.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841-61.

fatal to many persons, and the effects of that month were probably not unfelt after the year had closed; and also causes that were proper to last quarter rendered it more unfavourable to health than many seasons that were less remarkable for their mildness.

Marriages.—The marriage-rate in the first quarter of the year was 1·408 per cent., or, as it may be stated, if the same rate were in operation for a year 1408 persons would be married in that time out of every hundred thousand of the population. The average rate per cent. in the same quarter in ten years is 1·394. Following the Christmas quarter, in which the greatest number of marriages are celebrated, the period to which the present returns relate is that in which they are always found to be fewest.

The number of marriages reported is 35,528, against 33,274 and 33,953 in two previous March quarters. In London marriages were 5305 and 5737 in 1861-2; in the present year they rose to 6275. There was also an increase on both the previous corresponding quarters in the South-eastern Counties, the South-western, and the West Midland Counties, in Yorkshire, and the Northern Counties. Lancashire exhibits a revival in its marriages as compared with those in the first quarter of 1862; for in three periods taken in the order of time they were in that county

1859	2·327	7·429	·996	·478	·736	·920	1·255	1·735	3·018	6·644	14·019	31·376	43·747
1860	2·218	6·768	·683	·414	·712	·905	1·370	1·725	3·091	7·042	15·159	31·133	43·732
1861	2·268	7·176	·674	·433	·728	·923	1·265	1·690	3·008	6·890	14·654	31·992	44·835
1862	2·249	6·963	·770	·446	·717	·936	1·263	1·729	3·031	6·757	14·090	29·846	36·579
1863	2·424	7·743	1·061	·503	·739	·968	1·380	1·729	3·053	6·924	14·064	31·245	48·848

The Table may be read thus:—Of 100 males living of the age 35 and under 45, 1·358 died in 1838, 1·265 in 1839, and 1·162 in 1860; the average annual rate in the 26 years, 1838-63, among the aggregate of males in this decennial period of age was 1·274.

5431, 4882, and (this year) 5245. The increase is very considerable in Liverpool and West Derby, which have been comparatively unharmed by the prevailing distress.

The following districts of the cotton manufacture exhibit an increase in the marriages over those of one or both previous quarters :—

March quarter	-	1861	-	1862	-	1863
Prescot	-	113	-	134	-	145
Ormskirk	-	69	-	59	-	76
Chorlton	-	131	-	91	-	129
Salford	-	143	-	126	-	155
Manchester	-	951	-	829	-	1005
Clitheroe	-	36	-	28	-	42
Blackburn	-	259	-	216	-	237

The following are examples of decrease :—

March quarter	-	1861	-	1862	-	1863
Warrington	-	84	-	99	-	73
Bolton	-	305	-	312	-	231
Bury	-	210	-	173	-	153
Barton-upon-Irwell	-	81	-	80	-	59

In some of the above instances, as in many others throughout the country, fluctuations of the marriages in particular districts are probably caused by movements of the population.

Births.—The number of births in the quarter that ended 31st March was 186,341. In the same period of 1861 it was about 172,933; in that of last year it was 181,990. The annual birth-rate of the quarter (births to population) was 3·691 per cent., being higher than the average, which is 3·594. It was higher than it had been in any quarter during the course

of ten years, 1853-62, except the spring quarter of 1854 and the winter quarter of 1860.

If the last two winter quarters are compared in respect to births, it will be found that those of 1863 were more numerous than those of 1862 in all the eleven divisions, except that which is the seat of the cotton manufacture; unless the Northern Counties, where there was a trifling decrease, constitute another exception. Not only have marriages been comparatively few in Lancashire, but the removal of families from that county in quest of employment has been of sufficient importance to reduce the registration of births in the parts which they have forsaken.

Increase of Population.—The births of last quarter were in excess of the deaths in the same time by 58,245. The population would have received an accession amounting to 647 daily, if immigration and emigration had been equal to each other.

The total number of English, Scotch, Irish, and Foreign emigrants who left ports where there are Emigration officers, in the quarter ended 31st March, was 37,805. This emigration is superior in amount to that of any March quarter since 1854. The Australian Colonies attracted an increased number of settlers; but the United States, to which 24,900 persons sailed, were the place of destination to a great majority. Upwards of 17,000 natives of Ireland went to the United States in the quarter.

The emigration to the United States was more than three times as great as it was in the same period of 1862.

The number of English emigrants to all parts was about 10,075.

Prices, the Weather, and Pauperism.—Wheat was cheap. The average price was 46s. 7d. per quarter. In the corresponding period of 1861 it was 55s. 1d.; in that of last year it was 60s. 1d. Beef was near its usual price; the average lowest and highest prices of mutton at Leadenhall and Newgate were 5d. and 7d. per lb. by the carcase. Potatoes were cheaper than they have recently been at this season, the best having been sold at the Waterside Market, Southwark, at about 12s. per ton.

Mr. Glaisher writes, that with the exception of eleven days in March the weather at Greenwich was warm, and in the seventy-nine days the daily excess of temperature was on an average nearly five degrees. The period comprising December, January, and February was, as compared with corresponding periods, amongst the warmest on record. For those three months together there are only three instances of a higher mean temperature since 1771.

The mean temperature of last quarter was 42° 6'; and as far as records that can be trusted extend, it has been exceeded in the same period of the year in only two instances.

In regard to the four months ending 31st March, the mean temperature may be considered to have been as high as any that has ever been experienced in a season extending through the same months.

In the quarter the humidity of the air was below the average in January and March, above it in February. The rainfall was rather above the average in January, below it in the subsequent two months. In the southern parts of England there was little rain at any time in the quarter; north of 53° latitude there was a great deal in January, but generally in February and March the weather was dry.

The returns of pauperism are expected to be heaviest in the first quarter of the year; but those obtained for that portion of the present year show an over-growth, which much exceeds the product of an ordinary winter. In-door paupers were more last quarter than in the corresponding

season of 1861, while they were nearly the same as in that of 1862; but the poor relieved out-door were far more numerous than in either, as the following statement of the average numbers relieved every Saturday will prove:—

	In-door.	Out-door.
First quarter 1861	- 131,138	757,950
„ 1862	- 143,772	804,268
„ 1863	- 142,257	943,324

Deaths; and State of the Public Health.—A winter remarkably “mild” has also been remarkably unhealthy. The deaths in England in the three months that ended 31st March were 128,096, against 122,019 in the same period of last year, which supplies an example of average health in winter, and may be taken as a means of comparison. It will be an approximation to the truth, to state that people died in the quarter at the rate of 20,000 in a year, whose lives would have been saved if epidemics or atmospheric causes of a nature unfavourable to health had not been in greater force than usual. The rate of mortality was 2·538 per cent., the average being 2·498.

The mortality of small towns and rural districts was 2·323 per cent. (against an average of 2·28). That of the chief towns was 2·706 per cent. (against an average of 2·68). The country appears to have suffered from the effects of the winter more than the town.

In London a sudden interruption of early spring weather, by a fall of the temperature, occurred in March, and was followed by an extraordinary increase of mortality, which continued many weeks after the apparent cause had ceased, and warm weather had resumed its sway.

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,083 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

That the increase of deaths at that time was not confined to London appears in the report from Southampton, where they were in the latter half of March more than twice the number that had occurred in the earlier half of the month. But the deaths of the quarter in that sub-district were below the average, in consequence, as the Registrar supposed, of "the mildness of the weather and the absence of epidemics." While a decrease of mortality is at one place attributed to "mildness," an increase of mortality is attributed to the same cause at another; and perhaps the true reason is assigned in both cases. It may be presumed, if the common experience of mankind does not teach, that the fine weather which is grateful to the senses is also directly beneficial to the health. If a high temperature by day is succeeded by chill at night, or "mildness" of the season, as the rule, is chequered by quick transitions; and, particularly, if from badness of drains, or want of rain to scour them, sewage accumulates, and in the warm air gaseous products are evolved, the season will be unhealthy, and many will suffer that doom on which the poet moralised, when he had sung winter dissolved by the welcome change of spring. A fever epidemic prevailed at Witney in Oxfordshire, which the Registrar and the medical officer agreed in attributing to the mild weather and the bad sanitary condition of the district. There was "gastric fever" at Butler's Cross, and very much of it at North Lee, both places in Buckinghamshire, and reported to be deficient in drainage or other arrangements. In Suffolk, the mortality had increased at Fornham, and "low typhoid fever" had caused a great deal of illness at Wen-haston, in both cases on account of "the mildness of the season," and also in the latter case from personal uncleanness and want of cottage accommodation. At Dulverton in Somersetshire, "a great number of old people (says the Registrar) have succumbed during the late mild winter." The Registrar of Worcester, North sub-district, states that the mortality had been high amongst young and old; that measles followed by pneumonia had been fatal to the former, and a remarkably mild winter to the latter. But the Registrar of Helmsley, in the North Riding of Yorkshire, considers that a reduction of the mortality which occurred in his district, notwithstanding the prevalence of a virulent form of small-pox, was caused by the mildness of the season. It appears, however, that fine weather was not universal; for at Bolton it was "cold, damp, and changeable;" at Ashton-under-Lyne also "cold and damp;" and at Cheadle in Staffordshire, "damp and foggy."

In the South-eastern portion of England the death-rate was lowest; in the North-western Counties, Cheshire and Lancashire, it was highest, a distinction which the seat of the cotton manufacture has earned alike in its prosperity and adversity. But in comparing the returns of deaths in the Eleven Divisions, attention is immediately drawn to the fact, that in all the divisions, with one exception, the deaths were more numerous last quarter than in the March quarter of 1862; and the single exception is found in that division where the staple industry on which half a million of persons are dependent is overthrown, and for a twelvemonth four fifths of that number have subsisted, unless the pittance has been aided by previous earnings or sale of household stock, on less than *4d.* a day per head. Or if the deaths in last quarter are compared with the mean number of two corresponding quarters in 1861-62, the increase for England was nearly six per cent.; for London and the North Midland Counties 2.5 per cent.; for the South-eastern and South Midland Counties, and Yorkshire, 7 per cent.; for the Eastern, South-western, and West Midland Counties about 12 per cent., while for the North-western division the increase (0.3 per cent.) is hardly appreciable, and for Lancashire, which constitutes the most important part of it, is found an actual decrease of the mortality. If the sixteen most important cotton districts of Lancashire are taken, there was an increase of deaths in five, a decrease in the

remaining eleven. The increase was greatest in Chorlton (16 per cent.) and Oldham (21 per cent.) The decrease was great in Wigan, Warrington, Leigh, and Bury, in which places it was 17 and 18 per cent., greatest in Preston and Burnley, where it was 20 and 24 per cent. This is a brief statement of the facts, whatever may be the solution of the problem which it suggests.

It may be observed: 1. While England enjoyed at least its average amount of health in the two winter quarters of 1861–62, Lancashire was at those times more unhealthy than usual, and in the common fluctuations of epidemics and other disease more or less improvement of the public health was to be expected. 2. The emigration returns discover a remarkable increase of English emigrants since March 1862; for whereas the number in each quarter of 1861 and till April 1862, was from 5000 to 9000, since that period it has been from 10,000 to 14,000. The Registrar of Witton (Blackburn) mentions that a great number of families had removed out of his sub-district from want of employment; and it is probable that the populations of other parts have been diminished, enough to affect the local registers, by similar movements to places in England and beyond the seas, where that market for labour may be found which has failed the industrious at their own homes. 3. It will be gratefully admitted that the legal provision for the distressed, and the spontaneous liberality of their countrymen, have hitherto sufficed to maintain the people in health. But if the supply has been enough, it has not been more than enough, and its inevitable tendency is to a fall; and though it could be sustained for an indefinite time, it does not follow that the health of a community living in forced inaction could also be indefinitely prolonged, while that which has been called “the real life” of the people must be ebbing fast. 4. The Registrar of Wigan reports, that not a single death had arisen in his district from the distress; and as other local officers are silent on the deaths of operatives from want, it must be assumed that happily they had none to report. In London, deaths attributed directly to privation average about 30 in a year; but in the families of cotton operatives cases of extremity will be more rare at the present time than when the country is less awakened to their wants. At Runcorn, the wife of “a general labourer,” who had been little employed for a long time, was stated to have died from “chronic bronchitis and starvation;” and another woman, also the wife of “a general labourer,” died from “consumption accelerated by grief and starvation.” Both those deaths occurred in January. At North Meols (Ormskirk), a man and his wife died of typhoid fever, which they brought with them from Liverpool. The Registrar “believes that they died from destitution; nobody would go near them while the woman lived, except a female, who only went in “three times.”

The following interesting report has been received from the Registrar of the sub-district of Preston:—

Births 889; Deaths 531. The deaths are 179 less than in the corresponding quarter of the last year, and 135 less than the average for the last five corresponding quarters. The following diseases have been among the most fatal: bronchitis 82; phthisis 71; pneumonia 22; typhus 10; typhoid fever 10; diphtheria 8. 240 children died at and under five years of age. The births are 43 less than in the corresponding quarter of the last year, and 8 more than the average of the last five corresponding quarters. The mortality of this sub-district has been very low this quarter, as compared with the corresponding quarter of last year. The decrease has shown itself during each month, as will be seen from the following statement. For the weeks ending January 3d, February 21st, and March 7th, the following deaths were respectively registered: 37, 47, 37; in the corresponding weeks of the last year I registered 66, 75, and 65. The cotton trade is in a much worse condition than it was two months ago, and I fear that there is a still more gloomy prospect before us. The number of persons out of employment now is greater than it has been since the distress commenced. On the 13th January there were 12,303 persons out of work and 33 mills closed; but on the 14th March the numbers were 14,990 persons unemployed and 40 mills closed. The largest spinning and manufacturing firm, which employs upwards of 3,000 persons, reduced the time of working

from three days to two days per week on Monday, March 9th, in consequence of the large and accumulating stock of cloth which they have on hand. The most effectual method of mitigating the distress and preventing a further reduction in the hours of labour would be for those who have the means to purchase cotton cloth, so as to reduce the stocks now on hand. It has been stated that if this were done it would only entail an extra cost of about twenty shillings per year for each family. If no purchases are made the mills must of necessity be closed, and the whole of our factory operatives thrown out of work. It is to be fervently hoped that an adequate supply of good cotton may soon be obtained, so that our poor distressed operatives may be again fully employed, and then they will be enabled to eat their food with a sweeter relish because it has been earned by their own labour.

Second Quarter.—April, May, June, 1863.

In the last Quarterly Report it was stated that in the period to which it referred the birth-rate had been unusually well maintained. That rate was still higher last quarter; and in all the quarters of all the ten years, 1853-62, only two instances occurred in which it was as high or higher. This fact may be remarked in connexion with the generally healthy state of the population during last year. After a season of depression which extended over two years the marriage-rate rallied in the first quarter of the current year, and rose decidedly above the average in the subsequent quarter. The improvement indicates increased confidence in the minds of the people, in respect to their ability to earn a sufficient and comfortable subsistence. But in taking a general survey of the returns, that which chiefly claims notice is the fact that the mortality, which was high in the first quarter of the year, continued high in the quarter that ended on June 30th.

Marriages.—The number of persons married in the June quarter was 88,292; they were married at an annual rate of 1.73 to a hundred persons in the population. The average rate for the same quarter is 1.69 per cent. In the two corresponding quarters of 1861-2 the rates were 1.68 and 1.61. A certain number of the prospective alliances of those two years, deferred in expectation of better times, would doubtless attain their consummation in the present year.

The number of marriages was 44,146, against 42,012 and 40,853 in the corresponding quarters respectively of 1861-2. In London and in all the groups of counties into which England is divided in the tabular arrangement, the marriages were more numerous than they had previously been in the June quarter of 1862. In London they rose from 7209 to 7803; in the South-eastern Counties from 3328 to 3663; in the West Midland from 4950 to 5390; in the North Midland from 2653 to 2817; in the North-western, which embrace Cheshire and Lancashire, from 6401 to 7006; in Yorkshire from 4159 to 4536; in Monmouthshire and Wales from 2494 to 2810. Of forty English Counties only five appear in which there was a decrease; these were Kent, Northamptonshire, Devonshire, Cornwall, and Shropshire. Many of the districts of which the counties consist are unimportant in numbers; and not a few, more or less important, might be cited, which exhibit a decrease; but increase is the rule, and as such tends to show that the view which the marriageable part of the community were enabled to take of their position was on the whole satisfactory to themselves.

Liverpool and its neighbouring districts Birkenhead and West Derby mainly contributed to that improvement which is manifested in the marriage registers of the North-western Division. In those three districts the marriages in the June quarter of 1862 were 1533; in that of 1863 they were 1755. In Manchester and Salford together they were 1197 and 1342; in Ashton 220 and 258; in Blackburn 200 and 270; in Preston 213 and 238. The district of Stockport exhibits a decrease; and there are others, in the seat of the cotton manufacture, which, if they show little decrease in the marriages, were not able to furnish an increase. In such localities, as in others, it is probable that occupation was partially

restored and distress alleviated; but the movement of young men and women in quest of work was sufficient to depress the marriage returns more than it did in other districts.

Increase of Population.—The births exceeded the deaths by 71,219. Therefore each day in the three months gave on an average a natural increase of 783 to the population. Immigration and emigration modify the result.

It was stated in last Report that the emigration of the March quarter, consisting of 37,806 persons of the English, Scotch, Irish, and other nations, was greater than it had been in the same season since 1854. The Return of the Commissioners for last quarter shows that emigration had attained a magnitude that can hardly fail to surprise when the circumstances of the Western world, by which it appears to have been chiefly evoked, are taken into consideration. The number of emigrants rose to 83,290, which is more than in any June quarter since that of 1857. In the same period of 1861 it was about 38,000; in that of last year 47,000. The Australian colonies supply an increasing attraction; British North America also draws a growing number; but of the 83,290 emigrants, 56,436 (of whom at least 40,000 were Irish) chose the United States as their destination.

The English people contributed about a fourth part of the emigration to all parts.

Prices, the Weather, and Pauperism.—The lowest and highest prices of beef at Leadenhall and Newgate were 4½*d.* and 6½*d.* per lb. sold by the carcase. In the same period of last year they were 4*d.* and 6*d.* During the last twelve months the average price of the best quality has not varied. The price of mutton fell. In the June quarter of 1862 the worst and best qualities were 5*d.* and 7*d.* per lb.; and they were near those prices in the succeeding nine months, till last quarter, when they were 4½*d.* and 6½*d.* The average price of wheat fell to 46*s.* 2*d.* per quarter; that of the best potatoes to 120*s.* per ton against 190*s.* in the same quarter of last year. Beef furnishes the only exception to the comparative cheapness of the principal articles of food.

Mr. Glaisher writes that the period of five months that began with December and ended on 30th April was as warm as any corresponding period in meteorological annals. The first half of the last quarter, viz., from the beginning of April to the middle of May, with the exception of a few days, had a mean temperature which was on an average two degrees in excess daily. After the 17th May, for a period of nine days, it was no less than 6° under the average. Again the temperature rose, and was 3·25° in excess till 5th June, from which date till the end of the quarter the air was cold.

The mean temperature of the air in April was 49°; that of May 52°; and that of June 58°. The mean temperature of April was higher than that of the same month in any year since 1844. Days and nights in April were warm; nights in May and days in June were cold.

Rain fell to the amount of 5·6 in., of which 3·9 in. fell in June. In the preceding two months of the quarter the rain-fall was scanty.

This account of the weather is derived from the observations at Greenwich.

The pauperism of the June quarter declined, as is usual, on that of the March quarter; but as regards the recipients of out-door relief it was much greater than in the June quarter of 1862. The average numbers of poor persons relieved on the last day of each week, in three corresponding quarters, were as follows:—

		In-door.		Out-door.	
June quarter	1861	-	117,801	-	713,786
"	1862	-	127,861	-	782,113
"	1863	-	127,063	-	873,503

Deaths, and State of the Public Health.—After a period of two years in which the public health was better than usual, the mortality rose in the last three months of 1862, was high in the first three months (the winter quarter) of the current year, and continued above the average in the quarter for which the returns are now made. In this last period the death-rate was 2·308 per cent. per annum, whilst the average was 2·19. With the present exception, a spring quarter has not occurred since the year 1853 in which the rate of mortality was as high as 2·3.

Both town and country testify to an increase of deaths in their respective populations; for the rate in the chief towns was 2·470 (against an average of 2·34), and that which prevailed in small towns and country parts was 2·100 (against 2·03). Summer-like weather in the early year, and cold days or nights striking a sudden chill into the heart of it, produce effects from which neither city nor hamlet is exempt.

That vast town population that resides within “the bills of mortality” suffered in common with the provincial populations, and in its due proportion; for though those complaints that are more directly traceable to meteorological causes, namely, bronchitis and pneumonia, were little if in any degree more fatal in the metropolis than usual, both small-pox and scarlatina were very prevalent, and caused numerous deaths. Small-pox carried off 788 persons in London, or nearly 9 daily; scarlatina and diphtheria 1230. Though the former disease destroyed fewer lives than the latter, it was more powerful in inspiring the public mind with a salutary dread. It should not be overlooked that prophylactic measures are available against scarlatina as well as small-pox, and both maladies are subject to modification.

Small-pox was not confined to London; its presence, which assumed in some instances a character of virulence, is announced by Registrars in many and distant parts of the country. The following are the chief districts, parishes, or townships where the attack was of sufficient importance to procure a notice in the reports of the local officers:—In Surrey: Croydon and Godstone. In Kent: Maidstone and Rochester. In Berkshire: Reading and Kintbury. In Bedfordshire: Wing (Leighton Buzzard). In Essex: West Ham, Orsett, Rochford; Manningtree, Colchester, and Sible Hedingham. In Suffolk: Cavendish. In Cornwall: Bodmin, Truro, Redruth, and Penzance. In Warwickshire: Kilsby. In Lincolnshire: Grant-ham, Market Rasen, and Misterton. In Derbyshire: Derby and Glossop. In Cheshire: Stockport. In Lancashire: West Derby, Wigan, Didsbury, Chorlton-upon-Medlock, Manchester (where it was very prevalent), Ashton, and Oldham. In Yorkshire: Barnoldswick, Ripon, Harrogate, Wetherby, Yeadon, Elland (Halifax), Shipley (Bradford), Bramley, Leeds, Dewsbury, Barnsley, Ecclesall Bierlow, Sheffield, Bramham (Tadcaster), York, Sculcoates, Hull, Whitby, and Northallerton. In the Northern Counties: Stockton, Yarm, Bishop Auckland, and Chester-le-Street. Fear of the disease, minatory notices issued by Guardians, or the infection of example, have given a useful stimulus to vaccination in many places where it had been opposed by prejudice or had sunk into neglect.

Not only small-pox but also measles and scarlatina attacked the industrial populations both in Lancashire and Yorkshire. Of 287 deaths in the St. Helen's sub-district of Prescott 68 were from measles; and out of 371 in Wigan 72 were from the same disease. In West Leigh a fourth part of the total number of deaths was from measles, which was also very fatal in Bolton. In the sub-district of Oldham-below-Town out of 312 deaths 15 were from small-pox, and 57 from scarlatina. In the North sub-district of Sheffield 23 cases of small-pox and 20 of scarlatina were fatal; and in Brightside (Sheffield) 27 cases of small-pox, 25 of scarlatina, and 20 of measles were attended with the same result.

The mortality of London in the quarter was 2·40 per cent., that of the North-western Division 2·57, that of Yorkshire 2·59. Cheshire and

Lancashire constitute the North-western Division; and the death-rate in the latter county apart from the former, was 2.59. Liverpool, Manchester, and other large towns have long invested this county with an unfavourable distinction, which it is hoped the important measure now passed by parliament for enabling the distressed unions to borrow money for works of public utility will be successfully employed to remove. In the present day the rate of mortality in Lancashire furnishes a striking contrast to that of the South-eastern Counties, which was 1.97 last quarter. To reduce, if not to annihilate the difference, is not an impracticable task.

The deaths in London rose from 15,230 and 15,654 in the June quarter of 1861-2 to 17,263 last quarter. Those in the North-western Counties rose from 17,576 and 18,024 to 19,473; those in Yorkshire from 11,600 and 11,821 to 13,339. The increase in Lancashire and Cheshire in last quarter on the mean mortality of the two previous seasons was 9 per cent., and less than in London and Yorkshire, where it was 13 per cent. Taking particular districts of the cotton manufacture, there was an increase in Oldham; in Manchester and Warrington of 20 per cent.; in Chorlton and Wigan of 25 and 34 per cent. Measles and other epidemics, as has been shown above, were spreading through those parts. On the other hand there was a decrease in Ashton, Preston, and Chorley amounting in the last two districts to 20 per cent. or more. It is probable that fewer deaths have been registered in many districts in consequence of the emigration or removal of the inhabitants, for doubtless many villages besides Belmont, which the Registrar writes is "almost uninhabited, owing to the badness of trade," complain of empty houses; but in reviewing the whole facts of the present Return, they will be found to support the conclusion which former Reports tended to establish, that sickness has not been aggravated nor the mortality increased by the distress which has prevailed, and which happily to a certain extent has now been subdued. It must be regarded as a providential interposition in favour of the under-fed and half-clad workmen and their families, that the period embracing December and four succeeding months was, in the words of the Meteorological Report, distinguished by a temperature higher than in any corresponding period since 1771.

The leading facts in the financial history* of the distress may be stated in a few words:—The number of persons dependent on the Parochial rates and Relief funds was 500,000 before Christmas 1862, when the maximum was attained; at the end of June it was reduced to 256,230. Nearly half the burden is at the present time removed. The expenditure from both sources in December was 289,225*l.* It was reduced in June to 102,241*l.* The loss of factory wages per week, at the end of January 1863, was 172,018*l.*; at the end of June, 132,553*l.* The decrease in weekly expenditure from the Rates and Relief funds (the last week in December 1862 being compared with the last week in June 1863) has been in six months 20,000*l.* The total expenditure in twelve months from 30th June 1862 to the same period in 1863 was about 1,676,413*l.*, of which amount 1,054,413*l.* † was derived from Relief funds, and 622,000*l.*, expended on the out-door indigent only, from Parochial rates.

The improvement in the cotton districts, by which forty-seven local committees have been enabled to suspend operations, has arisen from various causes: the emigration or removal of operatives, the increase of out-door work, the partial revival of industry. The Public Works Act, if adopted and carried into execution with earnestness and goodwill, is expected to provide the wages of labour to a fifth or sixth part of the population who without its aid would be in want. But, notwithstanding

* See Report of the Central Executive Committee (Manchester, July 20th, 1863).

† A portion of this sum appears to have been expended in May and June 1862.

present encouragement, the Central Executive Committee takes a desponding view of the coming winter. Those external conditions of the cotton trade from which the ruin of the manufacture sprung remain unchanged, and there is little prospect of that cheapness of material on which former prosperity was based. Present alleviations of the distress will, some of them, cease when summer and autumn have passed. Private savings are spent, credit exhausted, relief funds diminished. Therefore it is not unreasonable to anticipate that though the distress of the approaching winter may visit fewer hearths, its severity, where it falls, may be greater, because the means of relieving it may be less.

The Registrar of Preston writes as follows :—

Sub-district of Preston.—Births 917 ; Deaths 483. The deaths are 112 less than in the corresponding quarter of the last year, and 123 less than the average for the last five corresponding quarters. I have again the satisfaction of reporting a great decrease in the mortality as compared with the corresponding quarter of last year, and which is the more gratifying because we are still suffering so severely from want of employment. In each of the first eight weeks and the tenth the number of deaths registered was below that of the same period of last year ; but in the ninth, eleventh, twelfth, and thirteenth there was an increase. In my report for the quarter ending December 1861, I stated that no death had occurred from small-pox in this sub-district ; since then I have registered 3,427 deaths, of which 1,687 were children of five years old and under, but not a single death has resulted from that disease, notwithstanding there have been a few cases of it, two of which brought the infection from Liverpool. This favourable result may be principally attributed to the great care manifested by the medical profession in carrying out the Vaccination Act. Since April 4th a gradual improvement has taken place in the cotton trade, as will be seen from the following statement, and a more cheerful feeling prevails respecting the future.

	June 20th.	April 4th.
Persons employed 6 days	11,008	5,824
" " 5 "	767	752
" " 4 "	474	2,000
" " 3 "	169	784
" " 2 "	3,199	3,109
" totally unemployed	11,807	14,955
Mills closed	25	38
Employed in ordinary times	27,424	

In the week ending June 20th 19,657 persons were relieved by the relief committee, and 11,647 by the guardians, being a decrease, as compared with the previous week, of 3,108 persons.

Third Quarter.—July, August, September, 1863.

The marriage-rate was above the average during the first nine months of the last year for which we have returns ; and it is well known that they afford a good indication of the opinions which the people themselves have of their prospects in life. The births were more numerous than they had ever been in the summer quarter before ; and the proportion they bore to the population in which they occurred was higher than usual. But while the aspect of the returns is favourable as regards marriages and births, a tale of deaths, which is heavier than that of any summer quarter since the year of epidemic cholera 1854, shows that the public health was far from being in a satisfactory state. The death-rate was considerably higher than it had been in any of the corresponding quarters that have intervened since 1854. Epidemic diseases spread with destructive force amongst the young ; and apparently the season was less salubrious than it usually is to older persons.

Marriages.—83,864 persons were married in the quarter that ended on September 30th, 1863. The weddings were 41,932, and exceed by 1332 the weddings in the summer quarter of 1862, and by 2048 the weddings in the summer preceding. The marriage-rate was 1.616 per cent., and this is above the average of ten preceding quarters. Thus the marriage meter indicates by its rise a steady improvement in the

condition and prospects of the great body of the nation. London takes the lead, and is followed by all its surrounding divisions; in the interval between 1861 and 1863 the summer marriages rose from 7322 to 8029 in the metropolis; from 3232 to 3508 in Kent and the other South-eastern counties. A notable increase also appears in the returns of the counties of Hertford, Oxford, Bedford, and Cambridge; in Suffolk and Norfolk; while marriage decreased in Wilts, Devon, and Somerset; but increased in Gloucester, Bristol, Salop, Stafford, and Warwick, which are pervaded in different degrees by prosperous coal and iron works. Leicester, Lincoln, and Derby show an increase; Nottingham indicates some depression.

The marriages of Cheshire and Lancashire fell from 7086 in the summer quarter of 1861 to 6380 in the corresponding quarter of 1862, but in the summer quarter of the year 1863 rose again to 7001, and thus gave the signal of reaction. Yorkshire sympathized with Lancashire,—especially in Huddersfield, Halifax, Bradford, and Hull,—but the reaction in this great county was more complete; and the people of Leeds and Sheffield married in greater numbers than they did in either of the two preceding summer quarters. The marriages increased steadily in the Northern Counties; and the Principality of Wales, either animated by loyalty, or by the heat of the iron trade, surpassed the Metropolis in the rise of its marriage-rate, which exceeded by 12 per cent. the summer rate of Wales in 1861.

Births.—The annual birth-rate in the summer quarter (July, August, September) was 3·34 per cent. against an average of 3·29. The total number of births was 173,439; in the same quarter of 1853 the number was 147,602. That part of the English nation from which the natural supply of population is drawn has so far increased in ten years as to produce more children by 25,837 than it did in a similar period in 1853.

The births registered in London were 24,589. The four Northern Counties, with their population of less than 1,200,000 as returned at last Census, registered as many births (11,199) as Monmouthshire and Wales with a population exceeding 1,300,000. In all the Eleven Divisions, with only a few considerable exceptions, the births were more numerous than they had been in either of the two previous corresponding quarters. There was a decrease on the mean of those quarters in the Eastern Counties amounting to nearly 3 per cent.; in the North Midland to 2 per cent.; and in the North-western (Cheshire and Lancashire) amounting to 3 per cent.

Increase of Population.—As the births were 173,439 and the deaths 112,504, the natural increase of the population was 60,935. The increase was at the rate of 662 daily.

The number of emigrants who left ports in the United Kingdom at which there are Government Emigration Officers was 58,320 in the quarter, of whom 20,008 were of English origin. 36,496 were bound for the United States; 6538 for the North American Colonies; 14,075 for the Australian Colonies; and 1211 for other places. The emigration was greater than it had been in any September quarter since 1854, and nearly three times as great as it was in that of 1861. There was an increase in the emigration to Canada and Australia, but it was insignificant as compared with the extraordinary result which the temptation of employment with high wages in the United States has produced by stimulating the movement, chiefly of the Irish people, to that country. But the temptation does not appear to operate on the Scottish mind, for it deserves to be noted that while 2059 emigrants sailed from ports in Scotland for British North America, and 1224 for the Australian Colonies, none went to the United States. Nor was there any emigration to the country last mentioned from Scotch ports in the September quarter of

1862; and there was almost none in that of 1861. It has declined since 1851, when in the corresponding three months it embraced 2854 persons.

Prices, Pauperism, and the Weather.—Wheat and potatoes were both cheap; the latter esculent ranged for the best quality from 70s. to 105s. per ton at the Waterside Market, Southwark, a price which is lower than what has been obtained at the same place at any previous time since the September quarter of 1859. The average price of wheat was 45s. 7d. per quarter, which is less than at any other time since March 1860; it has been falling during the last eighteen months. The average price of the better and worse qualities of beef sold by the carcase in the City markets was 5 $\frac{3}{8}$ d. per lb.; that of mutton 5 $\frac{1}{4}$ d.

The following figures show the average number of paupers relieved on the last day of each week in the last three summer quarters:—

		In-door.		Out-door.
September quarter	1861	- 112,930	-	693,631
„	1862	- 119,600	-	789,917
„	1863	- 120,343	-	817,238

This statement exhibits an increase in the present year, which arises from the circumstance that many recipients of relief in the distressed manufacturing districts have been transferred from the Local Committees to Boards of Guardians, and have thus prevented that decrease in the above returns of pauperism which the improvement in the condition of those districts would otherwise have effected. The number of poor persons relieved out-door by the Guardians in the cotton districts in the three months ending 30th September 1863 was 398,988. In administering relief to 148,228 of that number the Boards were aided by the Local Committees.

The weather in the quarter, as observed and described by Mr. Glaisher at Greenwich, was characterised by alternations of heat and cold till the middle of the period, and by cold attended with much wet during the last six weeks, circumstances which could hardly fail injuriously to affect the public health. From the beginning till the middle of July, the mean temperature of the air exceeded the average by two degrees; thereafter to the end of the month it was below the average nearly four degrees. Heat followed in the first fortnight of August, three degrees and a half in excess. For the remaining portion of the three months there was an almost daily defect of about two degrees in the temperature. The mean temperature of the whole period was 58·8°, which is about one degree below the average. The amount of rain measured was six inches, which is nearly two inches less than the average; but half of it fell in September, which was a moist month, when the two months which preceded it had been dry. Both days and nights in the earlier half of August were warm, but in September both were cold. Though the weather has been less favourable to health than it was in previous summers, the Report of the Registrar of Preston may be quoted here, for it is applicable to other districts besides his own:—“The bountiful harvest which we have had, and the abundant crop of potatoes, will be an invaluable blessing, and will greatly assist in mitigating the sufferings of the working classes during the winter.”

Deaths; and State of Public Health.—The total number of deaths in the last quarter was 112,504, against 101,232 and 92,381 respectively in the two previous summer quarters. In the same period of 1860 the number was only 86,312, and if last summer had been as healthy, it may be stated in round numbers that at least 23,000 persons would have been living when autumn came whose names were enrolled in the registers.

The increase of deaths on the mean of two previous corresponding quarters (1861-2) was equal to about 13 per cent. in London, 15 per cent. in the South-eastern Counties, 22 in the South Midland, 14 in the

Eastern, 19 in the South-western, 19 in the West Midland, 17 in the North Midland, 15 in the North-western (Cheshire and Lancashire), 21 in Yorkshire, 18 in the Northern Counties, and 7 in Monmouthshire and Wales. Hence it appears that the increase was least in Monmouthshire and Wales, greatest in the South Midland Counties and Yorkshire; and that in the Metropolis, in the Eastern and South eastern Counties, and in the districts of the cotton manufacture, it was from 13 to 15 per cent. The unfavourable influences that were at work pervaded the country generally, and Lancashire did not suffer more than most parts, but less than some. When the Central Committee for the relief of the distressed districts state in their Report (19th October), written some weeks after the complaints that prevail chiefly in the warm season have subsided, that "the health of the population is generally in a satisfactory condition," probably nothing more is implied than that the families of the operatives are as healthy as they usually are in October, though they may not yet have attained that measure of health which it is hoped the sanitary works that are to be begun or are already in progress will confer upon them.

Scarlatina and diarrhoea, widely diffused over the country, were the chief immediate causes from which the increase of mortality sprung. The deaths rose to 2·169 per cent. per annum, against the average summer rate of 1·98. In the Eastern and North Midland Counties the death-rate was rather below the average of England; in London it rose to 2·33; in Cheshire and Lancashire it was 2·43; in Yorkshire 2·45. That great division which contains the districts of the cotton manufacture has always asserted a bad preeminence in the tables of mortality; but notwithstanding the distress that still prevails, and the greater distress it has suffered, it will be seen that in the present returns it may be compared with Yorkshire without disadvantage. Its density of population is much greater than that of any other division, with the exception of London, and is more than double that of Yorkshire. Lately a certain number of the working population has removed, in what amount is unknown, and Yorkshire has doubtless gained part of that which Lancashire has lost; but this circumstance can hardly affect the comparison in any material degree.

The death-rate in the town districts of England was 2·410 per cent., against an average of 2·24. The mortality of the country districts was, as is usual, considerably less; but it was also much in excess of the summer average, for it rose to 1·862, against 1·69. It is obvious that cities are not the only haunts of those diseases that are propagated by foul air and bad water, and in homes of penury; nor are young rustics proof against the weather. In a thousand instances the water which town populations command within their houses, the countryman in the village or on the wild can only obtain with uncertainty and toil; his rations are meagre; his walls damp; the refuse-heaps are near his door, "for as a rule no rubbish is removed, but waits patiently the action of "mere natural chemistry;"* and shut up many hours of the night with his family he is deprived even of that which is supposed his inalienable birthright, the pure air, which invests his dwelling and seeks on all sides, but in vain, to be admitted.

A short list of districts, parishes, townships, or other places which have been specially noted by the Registrars as localities where scarlatina has sensibly increased the mortality will suffice to show how universally that disease has been diffused over the country. Besides many other parts, it prevailed in Godstone, Maidstone, Deal, Walmer, Havant (where it caused 20 deaths out of 48), Cowes, Ryde, Basingstoke, Uxbridge, Brentford, Ware, Standon, Northampton, Weldon, Peterborough, Toddington (where

* Thomas Carlyle : Life of Sterling.

out of 40 deaths about 30 were from scarlatina), Leighton Buzzard, Stratford in Essex, Grays, Great Burstead, Great Waltham, Colchester, Kelvedon, Coggeshall, Heddingham, Wickhambrook, Sudbury, Lavenham, Hadleigh, Stanton, Poole, Bere Regis, Newton Abbot (half of the 78 deaths there were from scarlatina), Dartmouth, Plymouth, Looe, Mevagissey (where the deaths were 49 out of 81), Truro, Falmouth, Helston, Penzance, Stogursey, Bishops Lydeard, Stowey, Keynsham, Bedminster, Bristol, Clifton, Gloucester, Cainham, Bridgnorth, Gresley, Tamworth, Sedgley, Worcester, Hinckley, Barrow-upon-Soar, Leicester, Uppingham, Bourn, Pinchbeck, Boston, Birkenhead (49 deaths out of 104 in Wallasey, a sub-district of Birkenhead, were from scarlatina), Warrington (where there were 143 out of 319), Pilkington, Chorlton-upon-Medlock, Hulme (where "the Black Brook" contaminates the air and spreads scarlatina and diarrhoea on its banks), Salford, Manchester, Preston, Huddersfield, Hunslet, Leeds, Ecclesall Bierlow, Sheffield, Doncaster, York, Sculcoates, Hull, Easton, Normanby, Durham, Sunderland, Carlisle, Abergavenny, Bedwelty, and Newport.

The Central Executive Committee for Relief of the distressed Districts has issued a Manual to the Local Committees, in which it recommends the establishment of temporary hospitals in places where infectious disease

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Districts of London; Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge; West and East Maidstone Sub-districts (Maidstone); Canterbury; Master Sub-district (Sheppey); Thanet, Dover, Hastings, Brighton; Shoreham Sub-district (Steyning); Portsea Island, Alverstoke, Southampton; Winchester Sub-district (Winchester); Reading, Brentford, Edmonton; St. Clement Sub-district (Reading); Oxford, Northampton; Peterborough Sub-district (Peterborough); Bedford and Kempston, and Bedford and Cardington Sub-districts (Bedford); Luton Sub-district (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salisbury; Weymouth Sub-district (Weymouth); Exeter; Torquay Sub-district (Newton Abbott); Plymouth, East Stonehouse, Stoke Damerel, Truro, Redruth; St. Mary Magdalen and St. James Sub-districts (Taunton); Bridgwater Sub-district (Bridgwater); Bath; Bedminster Sub-district (Bedminster); Bristol, Clifton; St. Nicholas and St. John Baptist Sub-districts (Gloucester); Cheltenham; Hereford City Sub-district (Hereford); Madeley, Shrewsbury; Stafford Sub-district (Stafford); Newcastle-under-Lyme Sub-district (Newcastle-under-Lyme); Wolstanton, Stoke-upon-Trent; Burton-on-Trent Sub-district (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; Kidderminster and Lower Milton Sub-districts (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; Loughborough Sub-district (Loughborough); Leicester; Boston Sub-district (Boston); Lincoln Home Sub-district (Lincoln); Great Grimsby Sub-district (Calster); Radford, Nottingham; Newark Sub-district (Newark); Derby, Hayfield, Stockport; East and West Macclesfield and Sutton Sub-districts (Macclesfield); Runcorn Sub-district (Runcorn); Congleton Sub-district (Congleton); Chester Castle and Chester Cathedral Sub-districts (Great Boughton); Birkenhead, Liverpool, West Derby, Prescott, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; Chorley Sub-district (Chorley); Preston; Lancaster Sub-district (Lancaster); Kelghley, Todmorden, Huddersfield, Halifax, Bradford, Hunslet, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; Doncaster Sub-district (Doncaster); Bootham, Micklegate, and Walmgate Sub-districts (York); Sculcoates, Hull; Scarborough Sub-district (Scarborough); Darlington Sub-district (Darlington); Stockton, Hartlepool; St. Oswald and St. Nicholas Sub-districts (Durham); Houghton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon-Tyne, Tynemouth; St. Cuthbert and St. Mary Sub-districts (Carlisle); Whitehaven Sub-district (Whitehaven); Kendal Sub-district (Kendal); Newport Sub-district (Newport); Cardiff Sub-district (Cardiff); Merthyr Tydfil; Llanaeloch and Swansea Sub-districts (Swansea); Llanelly Sub-district (Llanelly); Pembroke Sub-district (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 91 days; each of the last two quarters of the year, 92 days. In this inequality a correction has been made in the calculations, also for the difference between 365 and 365.25 days, and 366 and 365.25 days in leap year.

may have become general, as the best means of preventing the spread of the infection in families. It strongly urges house-to-house visitation, and other valuable sanitary precautions on their attention.

The deaths in Cumberland were 938 and 924 in the September quarter of 1861-2; they were in the last quarter 1159, and exhibited an increase of 24 per cent. In the district of Carlisle they were in those three summer quarters 232, 209, 287; in Cockermouth 195, 201, 218; in Whitehaven 169, 192, and 297. In the Cockermouth district the mortality

was 21 deaths to a thousand of the population ; in Carlisle it rose to 25 ; and in Whitehaven it rose as high as 20. Measles, scarlatina, and whooping-cough have been prevalent in Carlisle ; small-pox in Keswick, where there were 60 cases of the disease, and 5 fatal ; and the same disease has prevailed in the town of Cockermouth. "Fever" was exceedingly fatal both in the town of Whitehaven and at St. Bees.

The town of Salisbury affords a striking testimony to the good effects of drainage and water supply. The Registrar writes :—

"The number of deaths is far below the average, and it is the least registered in any quarter during the last five years. The healthy state of this district is to be attributed to the improved sanitary condition of the town. Within the last ten years a Local Board of Health has been established. The open drains that ran through the streets have been filled in ; a complete system of drainage has been carried out, and waterworks established, by which a plentiful supply of pure water is obtained. These works were begun in 1853 and finished in 1854 ; and the mortality of the district

has materially decreased since that date. During the last five years the annual average number of deaths has been only 185, while those for previous corresponding periods were 328·8, 261, and 215·6 respectively. The number of deaths for the last year, ending June 30th, was 162, which, taking the population at 9,000, gives only 18 to 1,000. The number for the last quarter is very remarkable, only 20 deaths occurring, while the average for corresponding quarters during the last five years is 38·4.”

Mr. Leigh, the Registrar of Deansgate, Manchester, has made some observations on dispensaries. He censures the rule by which applicants for the benefit of those institutions must be provided with a *recommendation* as “worse than useless,” by entailing the loss of important time, and other hurtful consequences.

Fourth Quarter.—October, November, December, 1863.

The general result of the Quarterly returns is favourable. Rising with an increasing population the number of marriages was greater than it had

in the Year 1863. By JAMES GLAISHER, Esq., F.R.S.

ever been before in any quarter. The marriage-rate (*i. e.* proportions of persons married to population) was high, though in some previous instances it had been higher. The births are returned for the last quarter of the year, and greatly exceed the average; while the deaths are also above the average, but to a much less extent.

In spite of some discouragement the year of the marriage of the Prince and Princess of Wales has been the anniversary of more than the usual number of such celebrations. The birth-rate of the year 1863 is the highest that has been observed in England; and the rate of mortality, owing chiefly to the prevalence of fever and of scarlatina, is also higher than is usual.

Marriages.—In the December quarter of 1863 the marriages were 51,904. They were about 3000 more than they had been in the corresponding quarter of 1861, or in that of 1862. The following divisions of the Kingdom have contributed in a prominent degree to this result:—the West Midland Counties, the North Western (the seat of the cotton manufacture), Yorkshire, the Northern, and the Welsh divisions. The populous districts of the cotton and woollen manufactures, as well as those of coal and iron, showed increased activity in nuptial celebrations, the result of increased or continued animation in their respective branches of industry. In Staffordshire the marriages rose from 2009 and 1955 in the December quarters of 1861–62 to 2294 in that of 1863; in Lancashire from 6078 and 5362 to 6499; in the West Riding of Yorkshire from 3807 and 3800 to 4278; in South Wales from 1695 and 1771 to 1831. The following large town districts are selected as examples of increase of marriages in the last quarter of last year:—

December quarter	-	-	1861.	1862.	1863.
Stockport	-	-	218	198	257
Liverpool, West Derby, and Birkenhead	-	-	1543	1663	1904
Manchester, Salford, and Chorlton	-	-	1475	1285	1488
Ashton	-	-	271	235	295
Blackburn	-	-	281	181	322
Preston	-	-	254	197	261

In England and Wales about 8000 persons entered into wedlock weekly. In London the number was about 1200.

The annual marriage-rate, *viz.* persons married to population, was 1·996 per cent., the average being 1·96. It is invariably highest in the last three months of the year, when the full employment of summer is succeeded by comparative leisure, and the earnings of harvest are not yet *drawn* for winter service.

The marriages in 1863 were 173,510. The marriage-rate of the past year was 1·688 against an average of 1·66.

Births.—178,297 births were registered in the last quarter of the year 1863; and the birth-rate of the quarter was 3·428, which is considerably above the average rate of the autumn quarter. Children are not born in equal numbers throughout the year; and, in general, births are at the highest in the winter quarter, and at the lowest in the autumn quarter of the year. But the seasons of the last year were exceptional, for the birth-rate was highest in the spring, and lowest in the summer quarter; and in all the quarters the rate was above the average.

The account of 1863 makes the registered births in that year 727,417; and the birth-rate is 3·539, or 0·111 above the average (3·428) of the ten preceding years. The births exceeded by 14,733 the births in the year 1862, which was itself more prolific than any year that had gone before it.

It is shown in the Census Report that the number of wedded child-bearing women is increasing faster than the general population, and this partly accounts for the increase of the birth-rate.

Increase of Population.—As the births were 178,297, the deaths 115,116, the ascertained natural increase of population in the last quarter of the year was 63,181. About 15,319 persons of English origin emigrated during the quarter. The emigrants from the United Kingdom of which the Emigration Commission furnishes an account amounted to 43,123, of whom about 2850 were foreigners.

68,280 emigrants of English origin sailed from ports at which there are emigration agents in the year 1863; and of their number 36,312 sailed to the United States, 2843 to the North American Colonies, 27,487 to the Australian Colonies, and 1638 to other places. The emigrants from the United Kingdom in the year were 214,555, after excluding 9203 foreigners who sailed from British ports.

Allowing for unregistered births, and for emigration, the increase of the population of England was about 215,000 in the year; while the emigration from Ireland reduced the rest of the population, so that the probable increase of the United Kingdom was about 190,000.

The Registrar General of Ireland is now empowered to register births and deaths, and under his able superintendence the country will learn the exact numbers in that part of the United Kingdom during the ensuing year.

Prices, Pauperism, and the Weather.—Fortunately for the country, while the price of meat remained nearly stationary, the prices of wheat and the prices of potatoes were kept down by the abundant crops, and this

was as advantageous to the people at large, as it was to the monetary world. Beef by the carcase at the London markets was quoted at 4*d.* and 6½*d.* in the autumn quarters of 1861, 1862, and 1863; mutton in the same quarters at 4¾*d.*, 5½*d.*, 5*d.* and 6¾*d.*, 6¾*d.* and 7*d.* The average price of beef in the last quarter was 5½*d.*, of mutton 6*d.* a pound. Wheat in the corresponding autumn quarters was 59*s.* 3*d.*, 48*s.* 2*d.*, and 40*s.* 6*d.*; potatoes 6*s.*, 5*s.*, and 3*s.* 6*d.* a hundredweight wholesale. While potatoes were 137*s.* a ton in 1862, they fell to 101*s.* in 1863. Wheat in the last autumn was 40*s.* 6*d.*, to which it fell progressively from 59*s.* 3*d.* in the autumn of 1861. The average price of wheat was 55*s.* 5*d.* in 1862, and 44*s.* 8*d.* in 1863; the reduction was 19 per cent.; and the wheat entered for home consumption fell from nearly *ten* to less than *six* million quarters.

The paupers in the receipt of relief were 951,927 in 1862, and 989,685 in 1863; but the distress culminated in the first three months of the year, when 1,085,581 paupers were on the lists, which at the end of the year contained 935,012; a number less by 105,165 than the paupers of the corresponding quarter of the previous year. The change is still greater in the cotton districts, where, as we learn from the report of the Central Executive Committee, the numbers in the receipt of relief from the guardians and from local committees was 448,955 in the last week of November 1862, and 170,850 in the last week of November 1863. It is difficult to conceive what the distress and the mortality might have been in the manufacturing districts had it not been for the Poor Law and for the charity of the nation, which has placed 1,323,493*l.* at the disposal of the able committee of which Lord Derby is the chairman.

The weather of the quarter presented some peculiarities. The temperature at the latter end of October and the beginning of December was colder than the average of the season at Greenwich; but the mean temperature of the season was 3°·2 above the average of 92 years. The rain in three months was 4·6 inches, which is 2·5 inches below the average. The water supply was therefore in some degree defective. Fog prevailed on 66 out of 92 days. Violent storms blew, particularly about the middle of the quarter, and swept the face of the earth.

Deaths and State of the Public Health.—The deaths in the last ninety-two days of the year were 115,116; and the mortality was at the rate of 2·213 per cent., or ·035 above the quarter's average. The mortality was at the rate of 2·422 in the chief town districts, and of 1·944 in the country and small districts; the mortality in the towns being near its average, and in the country above its average.

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1850.

473,837 deaths were registered in the year; and the mortality was at the rate of 2.305 per cent.; the average of the preceding ten years being 2.211. The death-toll instead of 22 was 23 in 1000; so of every 1000 living *one* was sacrificed in the year. The mortality of the year in the chief town districts was at the rate of 25, in the rest of the country 21, per 1000.

AVERAGE ANNUAL RATE OF MORTALITY in the 11 DIVISIONS of ENGLAND in the 10 Years 1851-60, and in each of the Years 1862 and 1863.

X. NORTHERN COUNTIES - - - - -	21.90	22.42	23.30
XI. MONMOUTHSHIRE AND WALES - - - - -	21.28	20.74	21.01

The number of deaths was higher in every division than it was in the corresponding quarter of 1861; and also in 1862, except in London in the West Midland Division, in the North Western (Lancashire and Cheshire), in Yorkshire, and in the Northern Division, where the deaths were less numerous than they had been. The deaths in the South Eastern Division rose from 8427 in the last quarter of 1861 to 9255 in the corresponding quarter of 1863; in the South Midland Division from 6176 to 6958; in the Eastern Division from 5552 to 6016; in the South Western Division from 8474 to 9708, where Wilts and Cornwall were the greatest sufferers.

Yet in Salisbury only 24 deaths were registered out of a population of 9939. This city was formerly one of the unhealthiest small cities in the kingdom; and in the ten years 1841-50, the mortality was at the rate of 28 in 1000: cholera with diarrhœa was fatal in the epidemic of 1849 to 20 in every 1000 of its inhabitants. Aroused into activity on the approach of the second cholera epidemic, a Local Board of Health was appointed, and proceeded to do its work effectively. The open drains running through the streets were filled up, a *complete system* of drainage

in the Fifteen Years 1849-1863.

was carried out, and works were established which provide a plentiful supply of water. These municipal reforms, commenced in 1853, were completed in 1854; and the death-toll has been levied with less severity ever since the year 1855. The mortality in the ten years 1851-60 fell to 24 in 1000, and though higher in the first was lower in the last five years of this period. The mortality was at the rate of 27 in 1862, and 15 per 1000 in 1863. The full effects of sanitary improvements only become apparent after some years; and the disturbance of the seeds of disease is sometimes followed by epidemics, as was apparently the case in Salisbury, where the mortality was at the rate of 29 and 27 in 1000 during 1854 and 1855; while in 1856 the mortality fell to 22, and after some fluctuation to 18 in 1860 and 1861. This happy healthy state was disturbed by epidemics of measles and whooping-cough in 1862, when 240 people died from all causes, and the mortality was at the rate of 27 in 1000. In the year 1863 the vigilance of the Board of Health was again rewarded, and the mortality fell to 15 in 1000; thus justifying the sanguine Registrar when he says:

“In my previous report I stated that in my opinion the low rate of mortality was owing to the completeness of the sanitary improvements lately carried into effect, and I attribute the continued favourable state of the public health in this district to the same cause. It is a remarkable fact, that in a population of 9,039 the deaths have been only 44 in a half year.”

At the rates still prevailing in other towns the deaths in a half year would have been 113; thus 79 lives were saved. The Sick City, healed in his county, is a cheering memorial near the ashes of Lord Herbert, which lie above Salisbury on a tributary of the Avon. But, as experience proves, the health of a city, like the sacred fire on the altar, requires the constant vigilance of its guardians, otherwise its flames expire.

Staffordshire and Warwickshire, in the West Midland Counties, as well as Yorkshire and the Northern Division, experienced a higher rate of mortality in the last quarter than they did in the corresponding quarter of 1861, but a lower rate than they experienced in 1862. This was also the case with Lancashire and Cheshire.

The mortality of the year 1863 in every division, except Wales, was above the average of the ten years 1851-60; and although the mortality of every division in 1862, except Divisions IX. and X., was below the average, the increase can scarcely be regarded without regret and alarm. It was due to fever and to a destructive epidemic of scarlatina, or scarlet fever as it is sometimes called, which spread over the country, and was most fatal. This zymotic disease was brought to light by the Arab physicians, but was confounded with fever, measles, and rosalia, until it was described scientifically by Sennert, by Sydenham, and by Morton, at the close of the seventeenth century, and again by Withering. Dr. Richardson has investigated scarlatina with great acuteness recently. It is an infectious disease, still requiring further study, as all its modes of propagation are not yet known, and little is done for effectually arresting its progress. The zymotic matter (*scarlatinine*) floats in the air of unventilated rooms, is attached to the clothes and furniture, and its corpuscles are apparently collected in the middens, the cesspools, and the drains, whose contents should be disinfected and deposited in the soil.

The Registrars report that scarlatina was unusually prevalent in the following sub-districts: Woking; Maidstone, East and West, 49 deaths by scarlatina, 132 by other causes out of a population in 1861 of 23,016; Teynham (Faversham), where typhus also prevailed; Eastbourne, 23 deaths from scarlatina, 50 from other causes, out of a population of 8127; Newport and Calbourne (Isle of Wight); Hursley (Winchester); Basingstoke, 23 out of the 67; Coleshill (Faringdon), 5 out of a population of 464; Baldock, 15 deaths; Hertford, 29 out of 66 deaths; Berkhamstead; Oxford; Northampton (St. Giles and All Saints), 58 deaths; Higham Ferrers; Newborough (near Peterborough); Ramsey (Huntingdon), 17 out of 38 deaths; Warboys and St. Ives; Cherryhinton (near Cambridge); Soham; West Ham, 26 from scarlatina, 7 from

typhoid fever, and 8 from small-pox; Bobbingworth, where typhoid fever and diphtheria also proved fatal; Tollesbury (Maldon), 6 of the 12 deaths were from scarlatina; Harwich, 22 deaths from scarlatina and 28 from other causes; Colchester (First and Third Wards), 32 from scarlatina; Coggeshall (near Kelvedon); Saffron Walden; Sudbury, where 44 of the 107 deaths were from scarlatina; Bury St. Edmund's; Eye, 21 deaths from scarlatina; Stradbroke; Ipswich, St. Margaret, 35 of the 98 deaths were from scarlatina; Eynsford, where diphtheria as well as scarlatina prevailed; East Dereham; Fakenham; Hillington (near Lynn); Marlborough; Melksham; Trowbridge; Heytesbury; Pewsey; Poole; Wareham; Ashburton; Buckfastleigh (Totnes), where 17 of the 35 deaths were from scarlatina; Plymouth, 48 deaths from scarlatina; Tavistock; Tiverton; Shebbear (the registrar of which earnestly begs for the interference of the General Board of Health, as measles and typhoid fever have been prevalent during the last six months); Looe; Newlyn (St. Columb); Grampond, 20 deaths from scarlatina and 27 from other causes out of a population of 5111; Truro, St. Agnes, 33 of the 75 were from scarlatina; Falmouth; Constantine (near Falmouth); Penzance, 56 deaths from scarlatina; St. Buryan (Penzance), 15 were from scarlatina and 8 from other causes, out of a population of 2488; Lansdown (Bath); St. Augustine, Bristol; Clifton, 56 of the 122 deaths were from scarlatina; St. George near Bristol, 28 of the 70 deaths were from scarlatina; Burton-upon-Trent; Tamworth, 22 of the 74 deaths were from scarlatina; Fazeley (near Tamworth), 52 were from scarlatina and 44 from other causes, out of a population of 6857; the three sub-districts of Worcester, 131 out of the 309 deaths were from scarlatina; Foleshill, 23 deaths; Holy Trinity, Coventry, 31 deaths; Hinckley, where measles was also fatal in 22 cases; Earl Shilton (near Hinckley), Leicester East; Oakham; Hayfield (near Stockport); Glossop; Hazelgrove (Stockport); Daresbury (Runcorn); Wallasey (Birkenhead); St. Thomas, Liverpool; Warrington, where 181 of the 314 deaths were from scarlatina; Latchford, where 32 of the 45 deaths were from scarlatina; Chorlton-upon-Medlock; Hulme; Ancroats and Newton (Manchester); Castleton Without (Rochdale); Dalton (Ulverston); Gargrave (Skipton); Nether Hallam (Ecclesall Bierlow); Sheffield South; Sheffield Park; Sheffield Brightside; Goole; Micklegate and Walmgate (York); Sutton and Drypool (near Sculcoates), where 59 of the 169 deaths were from scarlatina; Hull, the three sub-districts, where 117 of the 438 deaths were from scarlatina; Kirkleatham (Guisbrough); St. Oswald, Durham; North Bishopwearmouth; Sunderland, East and West; Monkwearmouth; Westoe (South Shields); St. Mary, Carlisle; Pontypool; Newport (Monmouthshire); Maesteg (Bridgend); and Machynlleth.

The mortality of the North-western Division (Lancashire and Cheshire), instead of being 17, was nearly 26 (25·51) in 1000 during the ten years 1851-60; it was 25·07 in 1862, and 25·84, or a little above the average, in 1863. The people of Lancashire have been so busy in clothing the world that their workpeople have been neglected, and been destroyed by thousands every year, for the want of the most elementary sanitary conveniences, which we may hope will now be provided under the Public Works Act.

Health of London in 1863.

The population of London is so vast, that it is subject to no accidental fluctuations; yet as the tide in some years carries more and sometimes less water from the sea into the Thames, so in some years the stream of

new comers into the population rises above and sometimes falls below the standard. The observations on the movement of the population have hitherto given, as the result of income and outgo, clear proofs of the greater strength of the influx; and judging by the past, about 44,266 souls were added to the population in the year 1863; 31,059 by excess of births, 13,207 by excess of immigrants over emigrants.

The births were 102,119 and the deaths 71,060 in the year. In 1853 the births were 82,254, the deaths 60,069, so the increase of the deaths is 10,991 and of the births 19,865 in ten years. The more rapid increase of births shows some improvement in the registration, which requires from the Registrars the utmost watchfulness.

The death-rate is 2.447 per cent. annually. The death-rate is slightly above (.024) the average of the last 24 years.

The following Table exhibits the numbers of males and females at different ages in London, as found on 8th April 1861:—

ALL AGES.	Under 5 Years.	5-	10-	15-	20-	25-	30-	35-	40-	45-	50-	55-	60-	65-	70-	75-	80-	85-	90-	100 and upwards.

F. 1,466,306	181,408	150,924	123,550	130,906	154,811	140,867	122,012	102,151	93,832	71,408	61,231	43,212	40,878	25,322	18,962	10,061	4,821	1,613	412	118

In England the proportion of Females in the population to Males is nearly as 105 to 100. In London it is as 114 to 100. The excess of Females is apparent in each quinquennium.

If we take the two decennials the mortality in the first (1840-9) is at the rate of 25.16, in the second (1850-9) at the rate of 23.63 per 1000 of the population; thus showing a progressive improvement of 1.53 deaths less in 1000 living during the second decennial. Dividing the twenty years into quinquennials, the rates of mortality were 24.44, 25.88, 24.17, and 23.08; and in the last four years 23.43.

The mortality was low (22.49) in 1860, and since then has slowly increased to 24.47. This fact should arouse the vigilance of the Boards of Works, for if they cease to carry out the recommendations of their health officers, the ground gained will be lost, and London will no longer be the healthiest large city in the world.

It must be borne in mind that the loss of life in London was formerly much greater in proportion to the population than the loss of life among the English in India; and that its present salubrity is as much the creature of art, imperfect it is true, as the fertility of the soil of Holland,

* This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 53 or 52 weeks of each year.

which the sea once covered. If the sanitary dykes be neglected, the three millions of people may again be overwhelmed by cholera, dysentery, and the plague, which are now relegated to the filthy cities of the Mediterranean and of the tropics.

What London wants is a constant supply of pure water, well-aired dwellings, drainage, and the removal of all the manure to the fields. Grand engineering works sometimes dazzle the understanding, and are accepted as substitutes for substantial efficiency, but they are only of use so far as they discharge these humble but useful functions.

London is divided into five groups of districts; and the mortality of the year in the west districts was at the rate of 23·24; in the districts south of the Thames 23·33; in the North districts 23·77. Thus over these great districts the mortality was nearly uniform, the rate having slightly exceeded 23 in 1000. The East districts lost annually 26·48 and the Central districts 25·51 in 1000 inhabitants. The mortality of the South group of districts was below its high average of the previous years, probably owing to the supply of a less impure water. It is one of those instances in which we have decisive proof of the influence of river water, saturated with nightsoil impurities.

If we take 17 in 1000 as the standard rate of mortality in a healthy population, the mean mortality of London in 1860-3 (23) yields in round numbers 6 unnatural deaths annually on every 1000 inhabitants; or 17,426 on the year, and 334 weekly. The end to aim at in London is the prevention year by year of the unnatural deaths, which are the direct result of conditions which to a large extent are under the control of the General and District Boards of the Metropolis.

The excess of mortality in the year is principally due to the zymotic class of diseases, which killed 13,276 persons in 1860 and 20,672 in 1863. 1996 persons died of small-pox in London, notwithstanding all the facilities for vaccination; 366 died of the same disease in the previous year, when measles was fatal to 2334 lives, while in the year 1863 its victims were 1634.

TABLE XXIX.—LONDON.—Deaths and Meteorology, 1849-63.

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer.

Fever prevailed in the years 1862-3, and no less than 3598 and 2808 deaths were ascribed to typhus, under which typhina (typhoid fever) and typhina (relapsing fever) are still included, as their diagnosis is not attempted by all practitioners.

The late Dr. George Gregory, in his classical lectures on the eruptive fevers, described the ravages of scarlatina with the hand of a master. "The years 1838, 1839, 1840 were," he says, "years of epidemic prevalence. It is probable that no epidemic of similar length and intensity ever before visited this country. In the whole year (1839) the deaths were 2500."*

Since that date the epidemics of scarlatina in London have frequently swelled the mortality; and in 1858-59 the deaths were 4184 and 3481; but in 1863 the deaths amounted to 4955. Since the time that Dr. Gregory wrote, diphtheria has sprung into existence, and the deaths of the year from that disease were 799.

2384 deaths from diarrhœa, 159 from cholera are recorded; and 3 from glanders.

Of alcoholism 231 persons died; 127 of delirium tremens, 104 of the common forms of intemperance. Bronchitis was nearly as fatal as it has been in any one of the last eight years; 6001 persons died of this disease, and 3680 of pneumonia.

547 women died of childbirth and its consequences, including 220 deaths by metria, sometimes called puerperal fever. This proportion is large; for, on the mothers giving birth to 102,119 children, it is more than 5 in 1000.

The violent deaths in London were 2507; of which 2138 were ascribed, chiefly by Coroners' juries, to accident (or negligence), 122 to homicide, 238 to suicide, and 1 to execution. Of the deaths by accident or negligence, 829 were brought about by fractures, 333 by burns and scalds, 61 by poison, 349 by drowning; thus fire and water are nearly equally destructive to life in London. Suffocation, chiefly of children, in bed or elsewhere, is becoming more prevalent than it ever was.

Mr. Glaisher's Tables deserve careful study; they show that the mean temperature at Greenwich was 50°·3; or 1°·9 above the average of 92 years. The winter was peculiarly mild, and so was the autumn; the first was 4°·2, the last 3°·2 above the average; the summer was 0°·7 lower than the average. The humidity of the atmosphere, taking saturation at 100, was 80; or 2 below the average of 22 years. The barometer was above the average, and the rain-fall was 20 inches, or 5·3 inches below the Greenwich average.

GREAT BRITAIN.

In Scotland 44,174 persons were married; the births of 109,325 children were registered; 71,421 persons died in 1863. In Great Britain persons married were 391,194; births 836,742; deaths 545,258. The

TABLE XXX.—Estimated Population, Marriages, Births, and Deaths in Great Britain, in the Year 1863.

—	AREA IN STATUTE ACRES.	Estimated POPULATION in the middle of the Year 1863.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
England and Wales -	37,324,883	20,554,137	173,510	347,020	727,417	473,537
Scotland - - -	19,639,377	3,101,345	22,987	44,174	109,325	71,421
GREAT BRITAIN -	56,964,260	23,655,482	196,497	391,194	836,742	545,258

united populations of England and Scotland comprised in the middle of the year (according to estimate) 23,655,482 persons.

The marriage-rate in Scotland (1·424 persons to 100 living) was less than the English marriage-rate (1·688). That of Great Britain 1·654. The Scotch birth-rate was 3·525, slightly less than the English, 3·539. The British rate 3·537. The death-rates of the Northern and Southern portions of the island were almost identical. The English death-rate, 2·305, is sufficiently near to be quoted, as also the British death-rate. England, with her metropolis almost as populous as the northern kingdom, and with many other great city populations, is as healthy as Scotland, which affords an average space of six acres to a person, while in England the area is less than two acres. The town population of England is to its whole population as 54 to 100. In Scotland the proportion is only 37 in 100 parts.

England, France, Austria.—The marriage-rate in France is almost invariably less than that of England, while in Austria it is usually higher. In 1863 the marriage-rate in England was 1·688, in France 1·600, in Austria 1·734 (persons married to 100 living). The birth-rate in England is always higher than in France and less than in Austria. In 1863 it was in the three countries 3·539, 2·686, and 3·988. The Austrian

TABLE XXXI.—Proportion per Cent. of Marriages, Births, and Deaths to the Population of Great Britain, in the Year 1863.

	ACRES TO A PERSON.	TO 100 PERSONS LIVING.			
		MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
England and Wales - -	1·82	·844	1·688	3·539	2·305
Scotland - - - - -	6·33	·719	1·494	3·525	2·306
GREAT BRITAIN - -	2·41	·827	1·654	3·537	2·305

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

TABLE XXXII.—Estimated Population of England, France, and of Austria, 1853 to 1863.

YEARS.	ENGLAND and WALES.	FRANCE.*	AUSTRIA.†
1853	18,404,368	36,325,000	21,327,290
1854	18,616,310	35,910,406	21,249,494

* The returns for France in the years 1861, 1862, and 1863 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1853-62.

† The returns for Austria exclude Hungary, Croatia, Slavonia, and Transylvania: but the proportions per cent. are estimated to represent the rates prevailing in the entire empire.

France than in England. In 1863 the English rate was 2·305, the French 2·244, the Austrian 3·110.

In Italy the marriage, birth, and death rates were 1·626, 3·912, and 3·115. The first was low; the second and third high. The birth and death rates agreed nearly with those of Austria.

I have been favoured by his Royal Highness the General Commanding-in-Chief with a return of the strength of the army serving abroad in 1863, and the deaths in the same period. The strength was 6243 officers, and 125,473 non-commissioned officers and men; the deaths of the former 99, of the latter 2110.

The mortality of officers is always considerably less than that of men. In 1863 the rates that prevailed in the two classes showed an unusual

TABLE XXXIV.—Italy. Population, Numbers, and Proportions per Cent. of Marriages, Births, and Deaths, exclusive of still-born, in each of the Years 1862 and 1863.

* British subjects are not particularly described upon Schedule C., but foreign names have been excluded from this account.

† The deaths of soldiers, marines, and invalided seamen from the Royal Navy were 83 in 1856, 59 in 1857, 124 in 1858, 126 in 1859, 103 in 1860, 69 in 1861, 123 in 1862, and 116 in 1863. The number is 947 in eight years, which, if added to the 2617 above, makes 4464, the total number of deaths of British subjects at sea in 1856–63, exclusive of those of merchant seamen.

There were born at sea in the year 344 children, British subjects. This number is exclusive of the children of seamen. And 694 British subjects, other than merchant seamen, died at sea in the same period.

TABLE XLIII.—Mortality of Merchant Seamen at Sea, in the 12 Years 1852-63.*

YEARS.	STRENGTH.	DEATHS.	ANNUAL RATE OF MORTALITY.
			To 100 living.

In the 12 years 1852-63	2,065,623	30,820	1'53

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar-General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a passenger dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether supposed to be a British subject or Foreigner" might be attempted. British and Foreign seamen are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

NOTE.—The numbers registered in 1887 are for the Half-Year ending December 31st.

NAMES ON THE REGISTERS, AND SEARCHES.

In the last half year of 1837, and in the 26 subsequent years, 33,997,135 names were inscribed on the registers as those of persons who had been born or married, or who had died. In 1863, 7715 searches were made at the Central Office, amongst that vast though not unnumbered throng of names, which its records associate with one or more of those three important events,—the landmarks in the physical existence of each human being.

For an account of the Causes of Death in 1863, I beg to refer you to a letter addressed to me by Dr. Farr, which will be found in the Appendix.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

ANNUAL ABSTRACTS
OF
BIRTHS, DEATHS, AND MARRIAGES.
1863.

* The Registration Counties consist of groups of entire Registration Districts, which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one

County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1863.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions: in these cases the two ceremonies are entered as two marriages. This column also includes 20 cases of divorce, viz., 10 men divorced who

married spinners, one man divorced who married a widow, 6 bachelors who married women divorced, and 3 widowers who married women divorced. For the districts in which these marriages took place see subsequent pages.

* In the other 61,233 cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1863.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1863—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 64 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and w for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a Table of the Deaths in the principal Public Institutions situated in the Districts of London see pages 83-4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; U indicates that a Workhouse belonging to another District or Union is included; H indicates Hospital or Infirmary; and L Lunatic Asylum.

† For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

‡ Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a few persons, or diseases which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

CAUSES OF DEATH at different Periods of Life, in the Year 1863.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypos, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120-125.]

* NOTE.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in *hospitals* proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the *Military and Naval Hospitals*, in Wandsworth for the *County Lunatic Asylum*, and in the other London Districts for *Work-houses situated out of the Districts to which they belong*. In all the other Districts of England the second rate of mortality is the result of a correction for either a *Naval or Military Hospital or Camp*, a *County Lunatic Asylum* or a *Work-house situated out of the District to which it belongs*. The particulars of these corrections are given in the Supplement to the 26th Report, pp. 21-iviii.

Deaths from several Causes, 1863.

163

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1863, in the DISTRICTS of England—continued.

* Note.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in hospitals proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the Military and Naval Hospitals, in Wandsworth for the County Lunatic Asylum, and in the other London Districts for Work-houses situated out of the Districts to which they belong. In all the other Districts of England the second rate of mortality is the result of a correction for either a Naval or Military Hospital or Camp, a County Lunatic Asylum or a Work-house situated out of the District to which it belongs. The particulars of these corrections are given in the Supplement to the 26th Report, pp. xi-lviii.

Population 1861. Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1863, in the DISTRICTS of England—continued.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND	
in 1863, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L.	175-195

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by WILLIAM FARR, Esq., M.D., F.R.S.

YEAR 1863.

SIR,

It is shown in your Report that the deaths were more numerous in this than in any previous year, and that the rate of mortality was high.

The causes of death to which the increase of mortality is chiefly due are in the zymotic class, and are most fatal to children.

The mortality is shown in Table I. to have been below the average at the several ages after 10, but to have been much above the average under that age in both boys and girls. The high mortality of the year is created by an excess of children's deaths.

TABLE I.—Excess or Defect of Annual Rate of Mortality per Cent. of Males and Females in England and Wales in the Year 1863 over or under the Mean Annual Mortality of the 26 Years 1836-63.

	AGES.—MALES.												
	ALL AGES.	0—	5—	10—	15—	25—	35—	45—	55—	65—	75—	85—	95 & upwards.
MEAN of 26 YEARS -	2·314	7·336	·869	·4·9	·793	·975	1·174	1·806	3·183	6·711	14·658	30·368	43·770
YEAR 1863 - - -	2·424	7·743	1·031	·505	·730	·968	1·330	1·729	3·065	6·924	14·064	31·345	48·848
EXCESS of 1863 -	·110	·407	·162	·004	·054	·007	·056	·077	·078	·213	·074	·077	5·078

The Table may be read thus: The Mortality per Cent. of Males in the Year 1863, under 5 Years of Age, exceeded the Mean Mortality per Cent. of 26 Years by ·607, while, on the contrary, at the age 45 and under 85 the Mortality in the Year 1863 was less than the Mean Mortality of 26 Years by ·077; the deficiency being indicated by prefixing the minus sign thus (-·077).

	AGES.—FEMALES.												
	ALL AGES.	0—	5—	10—	15—	25—	35—	45—	55—	65—	75—	85—	95 & upwards.

The great reigning disease of the year is SCARLATINA, which killed 30,475 children (chiefly). Diphtheria prevailed with some malignity; and this disease, which never figured in the returns before 1859, was fatal to 6507 children (chiefly). Small-pox, and croup, and diarrhoea were also prevalent.

While 4·551 in 1000 people died of zymotic diseases in the year 1862, the mortality from this class of cases alone was 5·887 in the year 1863. The difference is 1·336; and nearly the whole of it is accounted for by the above diseases.

The causes of 4955 deaths were not recorded; and of 3008 deaths the Coroners and other informants only enable us to infer that they were sudden. Causes of the remaining 465,874 deaths are recorded.

CLASS I. ZYMOTIC DISEASES.

The deaths by zymotic diseases amounted to 119,731, and they constitute one fourth of the total deaths, while they were in the proportion of

5,887 to 1000 living persons. Of the diseases in the class 114,538 were of the miasmatic order.

Small-pox was epidemic in many districts, and destroyed 5964 lives. It is less fatal than it was; but many lives are sacrificed every year by the negligence and ignorance of the parents, on whose care the children's lives depend. Measles destroyed 11,349 lives; whooping-cough 11,275 lives; croup 6957; diphtheria 6507; scarlatina 30,475.

The mortality by scarlatina was at the rate of 1·498 to 1000 persons living of all ages. The mortality by this disease ranged from ·746 to 1·055 in the seven years 1851-7. In the year 1858 the mortality by the disease rose suddenly to 1·572. It included malignant sore throat (cynanche maligna), with which diphtheria was at first confounded. In 1859 the character of diphtheria was generally understood; and of the mortality (1·513) the third part (·492) was ascribed distinctly to diphtheria, the rest (1·021) to scarlatina. The mortality in the next four years (1860-3) ran thus; scarlatina ·493, ·456, ·738, and 1·498; diphtheria ·265, ·227, ·244, and ·320.

The deaths by scarlatina in the year 1863 under five years of age were 19,222; 8192 at the age 5 and under 10. The mortality is highest in the third and the fourth years of age; but the mortality by scarlatina in youth and manhood is not inconsiderable; 2 deaths at the age of 75 and upwards are referred to this head.

4230 boys and 3962 girls of the age 5-10 died of scarlatina; 770 boys and 881 girls of diphtheria. One third part of the deaths at this age are by scarlatina.

The variation in the distribution of deaths over the ages depends upon the varying susceptibility to attacks, and upon the varying liability to succumb under attacks. The destructiveness of any disease may be expressed by one word, lethality*; and the lethality of the diseases which have for this purpose been investigated diminishes from infancy up to the age of puberty. So the 39,022 deaths in the nine years 1855-63 (see Table IV.) at the age 5-10 imply perhaps as many attacks of scarlatina as 96,280 deaths at the first quinquenniad.

It is the duty of parents to avoid the exposure of children at any age to infectious disease; but the above law implies that zymotic attacks are more lethal, and therefore the more vigilantly to be avoided, in the first stage of life.

TABLE VIII.—ENGLAND. Deaths from Fever—Typhus, Typhoid, and Typhoid —to 10,000 Persons living, and Proportional Number to 1000 Deaths, in each of the Fourteen Years 1850-63.

1863	18,017	8·86	38
Mean - -	17,144	9·09	41

* Lethare—to kill.

The fevers,—typhus, typhia (typhoid fever, including infantile remittent), and typhina (relapsing fever),—still demand attention; they destroyed 18,017 lives in the year, or 8·86 in 10,000 of the population. Of 1000 deaths 38 were by these fevers. The mortality was at the rate of 6·63 per 10,000 in 1860, and rose to 7·76 and 9·31 in the two following years. The mortality in the year 1863 is below that of the year preceding, and below the average, 9·09, of 14 years.

The fevers are fatal at all ages; more fatal in the first 5 years of age than in the second, in the second 5 years of age than in the third. The mortality rises to 8·65 for males and 9·16 for females at the age 15—25; of immigration into towns: it falls at 25—35, to rise from that decenniad through every subsequent decenniad of age.

The mortality of females by fever is higher than that of males at all ages from birth up to the age of 25; and after that age fever is more fatal to males than to females.

Dr. Murchison supplied the facts from which the lethality of fevers at different ages was deduced;* and this gives us the means of estimating the number of cases of fever out of which the deaths occurred.

The cases, as directly estimated, are given in Table VII.; and it may be assumed, as the cases in hospital are unusually severe and lethal, that they do not represent more than half the number of fever cases in the country.

It is difficult to overrate the importance of the etiology of these diseases, which are closely allied to plague, and are its representatives in England.

Erysipelas prevailed to a considerable extent, and 1920 deaths by the disease are recorded. Erysipelas is generally described as it appears in adults, but it is fatal in infancy, and of the 1920 deaths, 612 occurred in the first year of age. There was a considerable increase in the year on the deaths of the year preceding, and the increase was observed at nearly all ages.

TABLE IX.—Deaths by Erysipelas at different Ages in England and Wales in the Years 1862 and 1863.

Metria (puerperal fever) was fatal to 1155 mothers; or to 215 more than died by the disease in the previous year. It is well known that metria and erysipelas are closely allied; and that *erysipeline* induces metria under certain conditions.

Influenza has not recently been epidemic, and its attacks when fatal are often confounded with bronchitis or pneumonia.

Diarrhoea is an intermediate disease between dysentery and cholera, Whenever dysentery and cholera are epidemic, diarrhoea is prevalent;

* See Letter (p. 176, Table III.) in 25th Annual Report of Registrar General.

Among the developmental diseases of children are 8121 cases of premature birth, 1261 of malformation, and 4116 of teething.

Paramenia or menses (75), and childbirth (2433), constitute the whole of the second order, which comprizes 2508 deaths. The total deaths from childbirth, including metria, are 3588.

During 17 years, 1847-63, the deaths of mothers by metria and childbirth, to 10,000 children born alive, have been in the proportion of 50; or 1 in 200. And the proportions have ranged from 61 in the year 1848 to 42 in the year 1857. In 1861 and 1862 the proportion was 43; in the year now under review 49. Metria has been to some extent epidemic.

Only 27,268 persons are reported to have died of no designated disease, but of natural decay and old age; the proportion is about 58 deaths in 1000.

In a considerable number of cases children and old people, and to some extent persons of all ages, waste away or lose their strength without any obvious cause. These cases, registered under "atrophy and debility," were fatal in 28,193 instances.

V. VIOLENT DEATHS.

15,680 persons died by violence, or by obvious physical and chemical causes. They comprize 33 deaths in 1000; or 1 in 30 deaths. Of the population 772 in 10,000 died by these causes. There are besides these deaths others by drowning at sea, and among our army and navy in battle abroad, which go to the diminution of the people. They are not brought here into account.

This important class, which has been the especial subject of legislation, and has attracted more than any other the attention of governments, is divided into five orders; the first comprising deaths by accident or negligence, 13,772; the second by battle; the third deaths by homicide, 399; the fourth by suicide, 1319; and the fifth by judicial execution, 21. The homicides here referred to are undoubted deaths, which, according to the finding of coroners' juries, were manslaughters or murders.

The various ways in which murder, it is supposed, was effected, are displayed in Tables XVIII. and XIX. Of the 258 murders, 81 are infanticides, 34 boys and 47 girls, including infants: 176 children under one year of age, were murdered. Exclusive of the infanticides, 177 persons were murdered; 103 males, 74 females; thus the weaker sex were not the most frequent sufferers; moreover 100 males and only 41 females were manslaughtered.

Exclusive of 176 children under one year of age, 47 males and 35 females were murdered.

One murder only was by shooting; blows, cuts, stabs, drowning, strangling, and neglect were common methods. One boy under one year was poisoned by laudanum; 2 female children, and 2 female adults, were poisoned by prussic acid; one by arsenic and one by oil of vitriol.

The homicides fluctuate little from year to year; and since the year 1858 they have ranged from 16 to 21 homicides annually in every million of the population. The risk of murder in the present state of English society is therefore constant but inconsiderable.

As the homicides exceeded the average in the two last years, so did the executions. It is absolutely necessary for the safety of the public to remove the stock of organic, ir-claimable criminals from society for ever; and execution, which has hitherto been employed, is, as far as the criminal is concerned, the easiest kind of expulsion from unworthy life. But criminality, like insanity, is a disease, and the one state as well as the other should be regarded with the eye of a physician, who administers medicines as remedies, and not for the sake of inflicting pain.

In the first period of three years 1858-60, the reported annual deaths by homicide and infanticide were 353; in the second period (1861-63) 379; or more by 26 in the last than in the first. The annual executions were 9 in the first, and 16 in the second period.

Only one woman, aged 25-35, was executed in the year, when 20 men were executed, 6 of the age of 15-25; 10 of 25-35; 1 of 35-45; 2 of 45-55; 1 of 65-75.

The returned homicides in 6 years are to the executions as 2196 to 75, or as 29 to 1; while there is no doubt of the fact of death, its cause is frequently by no means clear. Advancing a step further, it may be uncertain, when the proximate cause is clear, as in drowning or suffocation, whether the death was induced by human agency or complicity. And even when the intervention of a human hand is beyond question, evidence may not be forthcoming to bring the crime home to the criminal. It may be suicide; it may be homicide. The intention of the mankiller has to be scanned, and the circumstances, before he can be pronounced guilty of murder. Then the plea of insanity, or, after the verdict, the final appeal to the mercy of the crown, may be successful in rescuing the criminal from execution. Thus it happens that the reported cases of homicide are to the executions in the proportion of *twenty-nine* homicides to *one* execution.

Suicide is returned as the cause of 1319 deaths in the year; so the proportion of suicides on the population is 66 in a million, homicide being 20, and execution 1.

The proportion of suicides to a million of the population on an average of the six years is 67; and the successive numbers run from the year 1858 thus:—66, 64, 70, 68, 65, and 66.

The most common way of committing suicide in England is by hanging, cutting, and stabbing; drowning, poisoning, and shooting follow in decreasing frequency.

Otherwise - - - -	4	3	4	5	5	4
All Ways - - - -	66	64	70	68	65	66

The constancy of these ratios, not only in the act but in the mode of suicide, has struck statisticians from the first, and it has been particularly well illustrated by M. Guerry and M. Quetelet.

Under the obscure workings of insanity, and amidst the conflict of the passions, in a great variety of unhappy circumstances, an order is observed, which can be expressed in laws, and men can by means of these laws predict past and future events. Thus it is found that 56 persons, 3 women and 53 men, shot themselves dead in the year 1863; and by virtue of the law, if it be assumed that the same number of persons shot themselves in each of the preceding years, the error will not be considerable; for the numbers were 54; namely, 53 men and 1 woman in the year 1862, and 59, 59, 54, and 60 in the preceding years; making the average annual number 57, from which the deviation is only 3 or 1-19th either way. By virtue of this law any one may predict that, the circumstances remaining the same, 57 persons now living will shoot themselves in the year 1866. In the six years 253 persons killed themselves annually by cutting the throat or stabbing themselves; the numbers ranging in those years from 215 to 276; that is from 38 below to 23 above the average.

Some erroneous inferences are sometimes drawn from these remarkable laws. It has been assumed, for instance, that because numbers expressing events, such as suicide, succeed each other regularly year after year, that those numbers are perfectly correct. Now this does not follow, for it has been found that the same law extends to errors, and it is quite possible, nay probable, that the number of suicides in England is understated, as some unknown numbers of the persons found drowned are suicides.

It is established as a law, that the same causes or equivalent causes invariably produce the same effects on the minds of men under the same conditions; but it does not follow from this principle that suicide cannot be brought under any control. A certain number of lunatics destroy themselves; anything, therefore, which prevents or cures lunacy diminishes suicide. In some in-door employments, where the conditions of health are disregarded, the tendency to suicide is developed; and by changing the conditions the tendency is diminished. Idleness, as much as strain of mind, predisposes to suicide; change the conditions and the disposition to suicide is changed. Suicide has generally been treated as an ignominious crime; but it sometimes puts forward pretensions to heroism and applause; it is therefore influenced by public opinion. In certain states the mind appears to be fascinated—as in the disposition to plunge from a height—by the presence of a fatal instrument, such, for example, as prussic acid, a pistol, a rope, or a razor; and the withdrawal of the means of death suffices to save the life. Diminish the facilities of procuring poison, and you diminish the peculiar kind of suicide. Discontinue the use of the razor in a country, and you diminish the cases of cut-throat; which are at present so numerous and so deplorable.

Burns and scalds.

45,460 persons, 22,526 males and 22,934 females, were burnt or scalded to death in the 16 years ending in 1863. The annual sacrifice was of 2841 human bodies in England alone.

It is gratifying to observe some diminution in the number of girls and women burnt in the year. The average number in previous years was 1433; in the year 1863 the number fell to 1306; 127 lives were saved. The proportion to a population of 100,000 was 14·8 and 12·4. Thus allowing for increase of population, one seventh of the accustomed tribute of lives was saved from the fire. Among young children of both sexes the saving of life was considerable. Men of the age 25-45 were killed in greater numbers than before, probably in mines and works; but at other ages the numbers of deaths by burning diminished.

TABLE XXI.—ENGLAND. Deaths and Mortality by Burns and Scalds in the Years 1848-63.

AGES.	BURNS AND SCALDS.

55 and upwards -	4	28	-	2	-	2	-	180·7	-	262·6

Of the 12,611 males dying of burns under 5 years of age, 791 were less than 1 year of age, 2968 were 1 year and under 2, 3255 were 2 years and under 3, 3018 were 3 years and under 4, 2454 were 4 years and under 5. Of the 10,308 females dying under 5 years of age, 786 were less than 1 year of age, 2344 were 1 year and under 2, 2423 were 2 years and under 3, 2535 were 3 years and under 4, 2230 were 4 years and under 5.

Subjoined are the suggestions for preventing death by fire, which I reprint from the Letter in your 24th Report.*

The number of these painful and untimely deaths may be much diminished by vigilance. And the press will, I trust, call attention to the subject, which is of incalculably greater importance than the burning of widows in India, or the drowning of witches in the middle ages, which have been abolished by the progress of science.

We burn at present 2766 men, women, and children of all ages annually in England and Wales. I trust that in a future Letter it will be my privilege to report a great reduction in this number.

I have the honour to be,

Sir,

Your obedient servant,

W. FARR.

To

The Registrar General.

* " 1. *Open fires*, lights, and kettles of hot water, should be surrounded by GOOD GUARDS. This precaution is of capital importance.

" 2. Children and young people, and old women, should be systematically taught the danger of fire.

" 3. The dresses of young children and old women should be made as

much as possible of worsted or wool ; which will protect them against cold, as well as against fire.

“ 4. The muslin dresses, and cotton and linen clothes, might very properly be starched with the chemical materials which are found by experience to render them, to a certain extent, incombustible.

“ 5. Private houses should all be provided on each floor of the sleeping apartments with the means of escape, in the event of the lower apartments taking fire during the night. Especial provision to be made for women and children.

“ 6. Fireworks, powder-works, and chemical manufactories require special precautions.

“ 7. Persons falling asleep near the fire, or near lights, (a) in a state of intoxication, or (b) in fits, are frequently burnt to death.

“ 8. Young children drink scalding water out of the spout of the tea kettle, or fall into scalding water. This happens often in the lower classes, when the mother is out at work, and the young children are left at home alone. The means of obviating this danger are evident.

“ 9. Special arrangements are, it is scarcely necessary to add, required for preventing the explosions of mines or of steam engines.”

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each District in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A, as Ashford, East.

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 197) and "Index of certain Towns" (page 207).

Printers to the Queen's most Excellent Majesty.
For Her Majesty's Stationery Office.

the 1990s, the number of people in the UK who are aged 65 and over has increased from 10.5 million to 13.5 million, and the number of people aged 75 and over has increased from 4.5 million to 6.5 million (Office for National Statistics 2000).

There is a growing awareness of the need to address the needs of older people, and the need to ensure that the health care system is able to meet the needs of older people. The Department of Health (2000) has published a strategy for older people, which sets out the government's commitment to improve the health and well-being of older people, and to ensure that the health care system is able to meet the needs of older people.

The strategy for older people is based on three main principles: (1) to improve the health and well-being of older people, (2) to ensure that the health care system is able to meet the needs of older people, and (3) to ensure that older people are able to live independently in their own homes. The strategy for older people is a key part of the government's overall strategy for health care, and is a key part of the government's commitment to improve the health and well-being of older people.

R E P O R T

TO

The Right Honourable Sir GEORGE GREY, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

*General Register Office, Somerset House,
30th April 1866.*

SIR,

I HAVE the honour to submit to you my Annual Report for the year 1864.

360,774 persons married, 740,275 children were born alive, and 495,531 persons died. The names therefore of 1,596,580 persons were added during the year to the registers deposited and indexed in the office: it is the greatest number ever recorded in one year, and raises the total number to more than *thirty-five and a half millions* since the commencement of registration in 1837.

The natural increase of population by the excess of births over deaths was 244,744, or 669 daily. The population of England and Wales in the

1863	20,534,127	173,510	347,020	727,417	473,237	254,180
1864	20,772,206	180,267	360,534	740,275	495,531	244,744

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

middle of 1864 probably amounted to about 20,772,308. The number of emigrants who left the ports of the United Kingdom at which Government agents are stationed during the year was 208,900; of whom 58,000 were of English origin, 15,319 of Scotch, 118,061 of Irish, and 17,520 were of foreign origin; the numbers are corrected proportionally for the 4877 whose birthplace was not recorded. Of the emigrants 147,042 departed for the United States, 12,721 for the North American colonies, 40,942 for the Australian colonies, and 8195 for other places.

MARRIAGES.

Marriage in England is a public ceremony. It can only be performed in churches, in registered chapels, in Quakers' meeting houses, in synagogues; that is, in some recognized place of public worship, and in the office of the Superintendent Registrar. To render the contract valid, six persons must be present in the office; the Superintendent Registrar, the Marriage Registrar, two credible witnesses, the bridegroom, and the bride. The Superintendent Registrar receives the declarations; the Registrar records the particulars of the transaction; and all the six persons sign the register. In registered chapels the minister or the priest takes the place of the Superintendent Registrar; the presence of the Marriage Registrar is indispensable. This appears to be an excellent arrangement, as it relieves the minister of a secular duty. The Registrar is not present at marriages in churches of the Establishment; and this is in some respects to be regretted, as the clergy, who are very naturally wrapt in the sacred functions of their office, sometimes do not write the names distinctly, and sometimes omit to mention whether the marriage is by licence or by banns. Only five persons are necessarily present at marriages in churches, and sign the register.

Mean . .	*823	1'648	3'343	3'224	122	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1543 persons married, 3089 births, 3236 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results.

To prevent unsuitable marriages in moments of passion, or marriages within the prohibited degrees, or marriages of minors without the consent of their parents and lawful guardians, some delay is interposed between the expressed intention and the consummation of marriage, except in the Established Church, where a man who has resided 15 days in a parish can obtain a licence without notice from the surrogate, and be married in an hour. Special licence of the Archbishop of Canterbury allows marriage to be solemnized "at any convenient time and place." The most common practice is marriage after banns, proclaimed upon three

* In the case of mixed marriages between Protestants and Roman Catholics some couples are married twice, and are counted twice in the Registers.

several Sundays in the church or churches of the parishes in which the parties reside; thus involving a delay of at least 15 days.

The licence of the *Superintendent Registrar* can be obtained on due notice entered in the "Marriage Notice Book," kept open for inspection during one whole day; so the marriage of which notice is given at the register office on a Monday may be performed on the Wednesday following at that office, or at a registered place of worship, as stated in the notice. The *certificate* of the Superintendent Registrar is issued after a notice of 21 days, during which it is suspended in his office, while the particulars are recorded in the "Marriage Notice Book," always accessible to the public, and affording an opportunity for "forbidding" the marriage or for entering a "caveat." Upon the grant of the certificate the marriage may take place either in the register office or in a registered place of worship, with the consent of the officiating minister. Thus the marriages of the Roman

* Disregarding the decimal point, this will read :— 804 marriages were celebrated to every 100,000 of the population; of these, 910 may be taken to represent the marriages of the higher and middle classes, and 787 those of the classes below.

Catholics and of the members of all religious bodies, including Quakers and Jews, take place without hindrance, and without any other necessary delay than that required by law for the grant either of the licence or the certificate of the Superintendent Registrar.

14,611 marriages in the year were performed in the Superintendent Registrars' offices without any religious ceremony, and some of the parties were neither connected with the Church nor Dissent. But probably, as marriage is a civil contract by common law, many of the 14,611 men and 14,611 women were members of religious bodies. This class of marriages is very unequally distributed over the country. There are few such marriages in London; and of these a large proportion is performed in St. Pancras and Islington. The greater part of the civil marriages in the South-eastern Counties takes place at Portsmouth, (Portsea Island), Brighton, the Isle of Wight, and Southampton; in the South-western Counties at Plymouth and the contiguous districts, at Exeter, Truro, and Bath; in the Eastern Counties at Ipswich and Norwich; in the South Midland Counties at Northampton, Wycombe, Oxford, Bedford, Chesterton, and Cambridge; in the North Midland Counties at Bristol, Birmingham, Leicester, and Derby. The civil marriages were proportionally few in Cheshire and Lancashire, except in Bolton, Oldham, Rochdale, Haslingden, Burnley, and Blackburn; and they were not numerous in Yorkshire, except in Halifax, Huddersfield, Leeds, and York. The excessive number of marriages in the register offices of Durham and Northumberland is perhaps partly due to the presence of a large colliery population, and partly to the prevalence of a feeling against the publication of marriage.

In Carlisle the marriages in the register office are more than double the number of the marriages in the Established Church, and more than six times as numerous as the marriages in Nonconformist and Roman Catholic chapels. Upon looking back through the registers it is seen that there was a sudden increase of these marriages in the year 1857, and that increase has since been sustained.

TABLE V.—Marriages in England. The Proportion per Cent. of Minors of each Sex, of Males and Females who signed the Register with Marks, and of Persons who were Widowers or Widows, in each Year from 1841 to 1864.

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 868 marriages took place; of 1,000 men married 767, of 1,000 women 676, signed the marriage register by writing their names; of 10,000 men married 662 were not of full age, of 10,000 women married 2009 were not of full age; of 10,000 men married 1384 were Widowers; of the same number of women married 907 were Widows.

This increase was a consequence of an Act of Parliament which passed in 1856, and contained the following clause :—

“ After the 31st day of December 1856, no irregular marriage contracted in Scotland by declaration, acknowledgment, or ceremony, shall be valid, unless *one* of the parties had at the date thereof his or her usual place of residence there, or had lived in Scotland for *twenty-one* days next preceding such marriage ; any law, custom, or usage to the contrary notwithstanding.”* This Act was levelled against Gretna Green marriages, and extinguished them ; at the same time it put a stop

* 19 & 20 Vict. cap. 96.

In my Thirteenth Annual Report, dated August 21st, 1854, addressed to Viscount Palmerston, who was then Secretary of State for the Home Department, a letter was inserted from a clergyman describing many of the evils of Gretna Green marriages (pp. vii and viii). I showed also to what an extent the marriages in the northern counties had been reduced by the Border marriages since the railways had afforded additional facilities to the lower classes for the trip into Scotland. Lord Brougham's Act was introduced in 1856, and came into force on January 1st, 1857.

It may be here stated that formerly several persons at Gretna and Springfield represented the Blacksmith, who in common story was wont to forge hymeneal fetters for runaway heiresses from England. Mr. John Linton, who established himself in 1825 at Gretna Hall, and converted it into an inn for the ease of lovers, himself performed the ceremony in an imposing costume, with a certain solemnity, and down to the year 1851 kept a register, which his widow informs me contains over 1,100 entries. In the year 1843 Mr. Murray, who kept the turnpike gate on the English side of the Border, effected a revolution by representing to English visitors, always in hot haste, that the further journey of two miles to Gretna Green was superfluous, as the wedding in his presence on the Scotch side of the border was equally valid. The argument was held to be conclusive ; and Mr. Murray continued his operations uninterruptedly until in the year 1854 he registered no less than 746 marriages, 42 on one day ; in the year 1856

apparently to the common practice in Carlisle of crossing over the border to get married at the famous turnpike, without ceremony, in the easy irregular fashion of Scotland. The marriages in Carlisle before the year 1857 were much below the ordinary average of England; and since that date the marriages have been about the average. So it is evident that the class of people who formerly married in Scotland now marry in the register office at Carlisle. They avoid marriage in places of religious worship, and entertain strong objections to the proclamation of banns; for there are more marriages in the Established Church after licence than after banns in Carlisle, while the proportion generally is as one by church licence to six by banns. As marriage after banns is less common in Cumberland than in other counties, it is the more singular, and excites unusual attention, to which the couples about to marry are naturally sensitive.* They are in some cases willing to buy a licence to evade the ordeal, and in others, to avoid some of its severity, seek the quiet of the Superintendent's office.

In Cardiff, Neath, Swansea, and Merthyr Tydfil in South Wales, and Bangor and Conway in the North, many marriages are contracted in register offices.

Seamen and miners avail themselves most freely of the register offices; and it is stated that some of the people, who rarely go to a place of worship, would not marry at all if it were not possible to marry as easily as it is under the Registration Act. Such marriages, therefore, are not withdrawn from the Churches of the Establishment, or from the chapels of the Nonconformists, but from the ranks of immorality.

the numbers rose to 757. Then passed Lord Brougham's Act, and the entries fell to about 30 in 1857, and 41 in 1858. Mr. Murray's pleasant occupation was nearly at an end; the plant was ruthlessly uprooted; the soil of Scotland lost its cherished prerogative. He died in the year 1861.

The following letter from Mr. Robert Forster, himself a blacksmith, on the English side, who took an active part in pointing out the evils of Border marriages, is not without interest, now Gretna Green marriages are no longer an English institution:—

“ Sir, Longtown, Thursday, March 8th, 1866.

“ I have been to Sark Bridge and also at Gretna to-day. Mr. Murray's widow is still living at the house with part of the family. I saw her son James, and he consented to let me look at the register of the last year before Lord Brougham's Act came into operation; that was in 1856. There are 757 entries of marriages in that year; 50 of them took place on May 10th, that would be one of the days in the term week Whitsuntide, and on November 8th there are 39 entries of marriages, that would be one of the days in the term week at Martinmas. He told me there were far more entries than 39 in one day in some of the term week days if the books were searched. He told me it was a serious thing for them, as his father built the house for the very purpose of marriages.

“ In 1857 there are only 30 entries of marriages altogether. In 1858 there are 41 entries altogether. When at Gretna I found Mr. Linton's widow was living at Annan with the marriage books of her husband in her possession. Several others used to keep books about Springfield; one of the main hands is named Douglas, a weaver by trade. If all the books that were kept were carefully looked into, it would reveal a fearful state of things, for any man that had a mind to keep a marriage book, and a few forms to fill up, was at liberty to start the system.

“ I am, Sir,

“ Yours most sincerely,

“ ROBERT FORSTER.”

* The subjoined note is from a gentleman well acquainted with the subject:—

“ I have ascertained that the charge for a licence in Durham and Northumberland is 2*l.* 12*s.* 6*d.*, whilst in Cumberland it is 2*l.* 2*s.*, but the difference does not seem sufficient to account for the wide difference in the marriages by licence. There is certainly hereabouts a disinclination to publication of banns, on account of the notoriety it gives to the intended marriage, at which, in many country parishes, idle lads congregate, and often annoy the parties. That, I think, has caused many to prefer going to the expense of a licence, and when several do a thing of that kind it becomes a kind of fashion which others follow. I can see no other reason.”

About eight marriages in ten are performed according to the rites of the Established Church; and of the eight, six are after proclamation of

* These are chiefly chapels of the " Wesleyan Methodist Free Church."

banns, which has the advantage in country places of publishing the contemplated act to all the parishioners, and giving parties interested and justified, an opportunity of "forbidding the banns." It seems to be admitted in these cases that the delay and the public proclamation of an act binding for life, affecting children unborn, and property to a variable extent, are useful, if not indispensable; but it happens that in large cities common names rapidly enunciated from the reading desk convey no information, and in cases where property or minors are concerned a licence can be purchased, which overrides every other security. The licence, descended from the age of indulgences,* is a fiscal advantage to officers of the English Church, and it is so popular among large classes that it can never be superseded, unless it is proved to be disadvantageous by decisive instances. The fee for a licence is a kind of fine on the parties for performing an act, without the usually recognized provisions against its evil consequences.

In Scotland marriages by licence are unknown; and regular marriages can only be solemnized after the payment of fees ranging from 5s. to 30s. for the publication of banns in the Established Churches of the parishes in which the parties have resided for six weeks. The banns are usually published on three consecutive Sundays; but in some parishes they may for a double fee be published on two Sundays, and for a treble fee on one Sunday. Thus the facility for an immediate marriage is sold in Scotland, as it is in England, to those who are willing to pay for it. The marriage is celebrated at the house of the minister, or the house of one of the parties.

In France the Registrar (Officier de l'Etat Civil), in all cases, proclaims the notice of marriage twice, at eight days' interval, and suspends it in front of the Town Hall (Maison Commune), or house in which the communal officers meet. Only three days after the last publication can marriage be celebrated.

Practically the marriages of the higher classes in England by licence, after complicated settlements, are probably entered on with more deliberation than the marriages of labourers and artisans by banns; but marriage by licence being more costly than marriage by banns, except in the north, it distinguishes classes, and is fashionable, so that nearly all people of the middle class and some artisans marry by licence, while all the labouring population marry by banns, or its equivalent certificate.

Marriages as far as the fees are concerned, may be thrown into two classes; (1) cheap marriages, and (2) dear marriages. The fees for marriage by licence vary in the several parishes, so do those by banns; but for the present purpose the fees for cheap marriages may be set down roughly at 12s., and the fees for dear marriages at 64s. Thus the man who marries by licence pays about 52s. for the privilege.

The number of cheap marriages in the year 1864 was 153,808, which at 12s. each cost 92,285*l.*; while the number of dear marriages was 26,579, which at 64s. cost 85,053*l.* When the justly liberal fees of the wealthy in churches and chapels, as well as the subscriptions of the Roman Catholics, are taken into account, after allowing for poor places, the annual marriage fees in England are as likely to be more as they are

* By virtue of stat. 25 Hen. 8. c. 21. the Archbishop of Canterbury and his proper officers are empowered to grant faculties, dispensations, and licences, as the Pope had done before him. It is observed in the Report of the Lords Committee on the Law of Marriage (1823) that licences or dispensations from banns were originally intended exclusively for the use of persons of noble and illustrious quality, but that the usage of two centuries had extended them to the convenience of other classes of society. * * * The privilege of a special licence "permitting marriage at any time, in any church or chapel, or other meet and convenient place," however, is still restricted to persons of condition, * * * but does not bar the Archbishop of Canterbury from granting such favours beyond these specific limits in certain circumstances for the fee of about 30 guineas.—*Shelford, Law of Marriage*, pp. 259-60.

to be less than 200,000*l.*, of which the people who marry by licence,—one seventh of the total number,—may pay about the half.

The marriages of the year are classified in the Table VIII *a.*

And Table VIII *b.* exhibits the proportion of marriages of three kinds in counties. It will be observed that the proportion of marriages by licence varies considerably in the several counties.

Marriages are solemnized in more than 11 cases out of 12 by religious rites. While 8 married in register offices, 92 men per cent. married in churches, chapels, synagogues, and meeting houses in the face of their respective communities; the law now oppressing no conscience, but allowing the utmost freedom of choice, as far as religious ceremonial is concerned. Under this equal system 78 in 100 marriages are celebrated according to the rites of the Church of England; and 14 according to the rites of the various religious bodies. Exclusive of Roman Catholics, Jews, and Quakers, who all marry rigorously according to their own rites, and exclusive of the marriages in register offices, 156,710 marriages were celebrated; 15,627 at Nonconformist chapels, and 141,083 at churches. The marriages in the churches were in number to those in chapels as *nine to one.*

Up to the year 1837 marriage, except in the case of Quakers and Jews, could only be solemnized in England according to the rites of the English church; and much must be allowed for habit, and for what may, as in the case of the licence, be called fashion; much also for the appropriate, generous, and natural sentiments which the English marriage service embodies: but this high proportion of nine marriages at church to one at chapel is evidence of the willing acceptance by many Dissenters of a church rite unencumbered with sectarian shibboleths.*

TABLE VIII *a.*—Marriages in England and Wales in 1864 by Licence and otherwise.

	Numbers.	Proportions of each Class to 100 Marriages.	
Dear Marriages, each costing for fees and stamps about 6 <i>s.</i> on an average:—

Cheap Marriages, each costing for fees about 12 <i>s.</i> on an average:—			
CLASS II. (1) At Church after Banns - - -	} With Religious Ceremony {	} 78·45	
" (2) At Church on Superintendent Registrar's Certificate - - -			116,340
" (3) In Registered Buildings on Superintendent Registrar's Certificate † - - - - -			4,361
	} Without Religious Ceremony {	}	
			20,794
CLASS III. (1) In the Register Office on Superintendent Registrar's Certificate -	12,204	6·82	

† The Licences granted by the Superintendent Registrars have been estimated at 6,206 from a return of 24,822 stamps issued by the Inland Revenue Department in the 4 years ending March 31st, 1865.

* " Anglo-Saxon ideas of female rights were just and liberal. Women were permitted to possess and dispose of property, nor was a person of any wealth enabled to marry, at all events, among his equals, until he had made a legal settlement upon his intended wife. It was, however, the usage of ancient England, as of cognate nations, to withhold the formal conveyance of this provision until the morning after marriage. Hence the dowry of an Anglo-Saxon lady was called her *morning's gift.* Her friends

The Marriage Act of Lord Hardwick, rendering the celebration by church rites indispensable, was not opposed by the Dissenters in 1752;

NOTE.—The results in this Table were obtained without distributing proportionately a certain number of Marriages in each county where the returns omitted to state under which of the heads, according to the rites of the Established Church, they should be referred, but the above proportions would, it is believed, remain unaffected by the correction.

had agreed upon a certain provision for her in the event of a proposed marriage; and until the contract was completed on her part, the husband was not expected to complete

and subsequently Unitarians were the leading successful agitators for greater freedom; for it was admitted on all hands, as the Church service implies a belief in the Trinity, that Unitarians had as good a claim to relief as Jews and Quakers. This they and all other Dissenters obtained under the Marriage Act of 1837; and every year the marriages at the chapels of Nonconformists are increasing.

I have before endeavoured to show that a general relation exists between the price of wheat and the number of marriages in England. But it may be inquired whether the price of wheat and the causes with which it is associated have the same influence on the upper and the lower classes of society.

Considerable difficulties lie in the way of such a classification; but if we assume that the population living in houses assessed at 20*l.* and upwards represents the class marrying by licence, then it will be possible to determine the influence of prices on the marriages of the lower and the higher classes.

This is done in Table IV.

The number of houses of the rent of 20*l.* and upwards assessed for duty was shown at the last Census to be 13·905 per cent. of the total number of inhabited houses of England and Wales* ; in the year ending April 1865 it was 14·789; and by a singular coincidence the marriages by licence in the year 1864 are to the total marriages in nearly the same proportion, or 14·734 per cent. There is no constant relation between the two classes of facts in the several counties, where the fashion in respect to dwelling-houses bears no invariable relation to the fashion in respect to marriage by licence or otherwise. If, however, the population be divided into two sections, in numbers proportional to the two classes of houses, there will be 3,073,163 in the first section who may represent the class of people marrying by licence, while the remaining 17,699,145 may represent the class of people marrying in the cheaper fashion by banns or certificate.

The marriages by licence (26,579) bear nearly the same proportion to 3,073,163 people as the marriages by banns and certificate (153,808)

it on his. But although the preliminaries of marriage were necessarily civil, due care was taken for impressing it, upon the whole, with a very different character. The mass priest was to pronounce a solemn blessing at nuptial ceremonies, unless one or both of the parties had been married before."—*The Anglo-Saxon Church, its History, Revenues, and general character.* By Rev. H. Scames, M.A., p. 278.

"The marriage contract by the old law appears to have been in England, as in most other states, essentially a civil contract, and it required no ecclesiastical sanction for its validity. * * * It is true that the Ecclesiastical Courts considered themselves as entitled to disavow all marriages not contracted according to ecclesiastical ordinances. * * * But at common law the marriage was good, and the heir of such a marriage would have inherited.

"In *Wigmore's* case, Salkeld, 438, Lord Chief Justice Holt is thus reported: 'By the common law a contract *per verba de presenti* is a marriage, as '*I take you to be my wife.*' So it is of a contract *per verba de futuro*, '*I will take,*' &c.; if the contract be executed, and he do take her, it is a marriage, and the [ecclesiastical courts] cannot punish for fornication, but only for not solemnizing the marriage according to the forms prescribed by law, but not so as to declare the marriage void.'

"Marriage was by law (26 Geo. 2. c. 33.) made contractable only (except as to Jews and Quakers who are left in possession of the former freedom of *all sects*) according to the rites of the Church. The jealousy of the other sects seems to have given way and submitted to this compulsory conformity to the establishment.

"Convenience in registration, and general agreement in point of doctrine, as well perhaps as some attempts made to disturb their marriages in the ecclesiastical courts (see *Heydon v. Gould*, Salkeld, 119), had, it would appear, induced the Dissenters, except the Quakers, almost constantly in practice to resort to the Church for marriage. When the Marriage Act (1752) passed, therefore none but Jews and Quakers complained. Conformity as to all other persons became compulsory by the operation of this Act. * * * Evidence of Edgar Taylor, Esq., F.S.A., before Select Committee of House of Commons on Parochial Registration, pp. 81-2."

* Return by Inland Revenue Department.

bear to the 17,699,145 people; in one case it is .865, in the other .869 per cent.

If we make an estimate of the marriages by licence in previous years, and assume that the higher and lower classes are in nearly the same proportions as they were in the year 1861, it will be found that the proportions marrying in the two classes are no longer the same, but vary often in inverse directions, the general result being that among the classes marrying by banns and certificate high prices depress marriage, while if they have any effect on the class marrying by licence it is the reverse. See Table IV.

It may be interesting here to give the proportions of marriages to population in Scotland from the last Report of the Registrar General of that portion of the United Kingdom.

MARRIAGES to every 1000 of the population in the year 1862, the date of the last Report for Scotland.

	ENGLAND.	SCOTLAND.
By Rites of Established Churches - - -	6.38	3.02
By Rites of other Protestant Denominations, &c. -	.70	2.96
By Rites of Roman Catholics - - -	.36	.58
By Civil Ceremony in England; irregularly, &c. in Scotland - - -	.63	.12
	8.07	6.68

The greatest discrepancy arises under the last head. Marriage is not held valid in England unless it is registered by the public officer as well as performed in the presence of attesting witnesses, so that here no valid marriage is unregistered. That is not the case in Scotland.

In England as well as in Scotland a certain number of couples live together in a state of concubinage; but in Scotland the line which divides "irregular" marriage from concubinage is so indistinct that even the courts of justice are not always successful in tracing it. Dr. Stark believes that unregistered irregular marriages are few in Scotland, and are confined to the lowest classes: upon this assumption it is evident that marriage is not so frequent in the north as in the south.

The total registered marriages in the *United Kingdom* were 230,435 in the year 1864; the numbers for Scotland being unrevised, and those for Ireland probably defective as it was the first year of registration. The registered marriages of *Roman Catholics* in 230,435 are only about 29,528; so if the Roman Catholic priests in Ireland have returned all the marriages which they solemnized in 1864 this would imply that the number of *Roman Catholics* in the United Kingdom is much below the usual estimate.

Marriage seasons.—Unlike birth and death, marriage is a voluntary act, and if men so will, all the marriages of a country may be celebrated in any single month of the year. But human will is influenced by motives, and these appear to operate all through the seasons of the year with variable force. In London the close of the season among the higher classes is a matrimonial epoch; among the working classes the festivals of Whitsuntide and Christmas, and the season of Lent exert some influence, so do the terms of service, which vary in different counties. The geniality of spring is perceptible; but Lincolnshire is the only county in which the spring weddings exceed the autumn weddings in number. The accumulations of autumn supply a store of food, and the harvest wages of the young swains in agricultural districts are often wisely

invested in the furniture of a cottage: it has already been shown that workpeople are influenced in marriage by economic conditions and prospects.

It might be supposed that marriages take place indifferently on any day of the week. But it is not so. Few marriages are celebrated on a Friday. Now Friday was in former times the day which would be especially devoted to these celebrations, as is implied by the names *Dies Veneris* of the Latins; and Friday, the day of the Saxon goddess Friga.

This day was chosen by the early church, perhaps partly in opposition to Paganism, as a day for carnal mortification; it was the day of the crucifixion of Christ; and hence the festive Friday of the Saxons, and the day especially under the star which astrologers held was most fortunate, fell into the category of "unlucky days." Seamen will not sail, women will not wed, on a Friday so willingly as on other days of the week. The Sun, Moon, and Saturn have gained by this silly superstition, as is shown in the Table below. Half the weddings are celebrated on Sunday and Monday; Saturday has more than its average number, and in the southern as well as the northern counties the Saturday marriages are the most numerous. It has been suggested that the pocket of the workman who has no account at the bank for savings, and lives on weekly wages, is often empty on Friday, which lays his mind open to gloomy omens, and indisposes him, while on Saturday he is exhilarated by the money which he throws into circulation on the three following days. Economy of time is an alleged motive for Sunday weddings.

Re-marriages.—While 147,914 bachelors wedded spinsters, and 7511 bachelors wedded widows, 16,117 widowers wedded spinsters, and 8845 widowers wedded widows. Thus 155,425 bachelors and 24,962 widowers wedded 164,031 spinsters and 16,356 widows. Of 100 men married 86·16

TABLE VIII c.—Number of Marriages on each Day of the Week in certain Districts of England in 1864.

DAYS OF THE WEEK.	Proportional Numbers to 100 Marriages.	Total of Districts.	The Extra-metropolitan part of the County of Surrey and part of Kent Extra-metropolitan.	District of St. George Hanover-square.	Districts of St. George in the East and Whitechapel.	District of Lambeth.	District of Birmingham.	District of Manchester. Saturday -	17	694	155	41	34	72	56	185	151

(a) Of 459 Marriages on Sunday, and 253 on Monday, in the aggregate, in these four Districts in the June Quarter, 69 were performed on Whit-sunday and 75 on Whit-monday.

(b) Including 12 Marriages performed on Good Friday.

(c) These Totals include the following number of Marriages not performed according to the Rites of the Established Church; viz., 4 in St. George Hanover-square, 79 in St. George in the East and Whitechapel, 11 in Lambeth, 131 in Birmingham, 146 in Manchester, and 231 in Cumberland, Westmorland, and part of Northumberland.

were bachelors, 13·84 were widowers; the proportions were nearly six bachelors to one widower. Of 100 women married 90·93 were spinsters, 9·07 were widows; of eleven, ten were spinsters, one was a widow. The proportion of re-marriages to first marriages is higher than it was 20 years ago. The highest proportion of men re-married is in Wiltshire, of women in Hampshire.

Minors.—11,934 men and 36,235 women married under age; so in 100 of each sex 6·62 men and 20·09 women married before attaining the full age of 21.

Signature of marriage registers.—The bridegroom and the bride invariably sign the marriage register. In the year 1864, of 180,387 couples married, it is found that:

The bridegroom *and* the bride wrote their names in 106,569 instances.

The bridegroom *or* the bride made a mark instead of writing the name in 47,236 instances. [15,416 men and 31,820 women.]

The bridegroom and the bride both *signed with marks* in 26,582 instances.

41,998 bridegrooms and 58,402 brides made their marks instead of writing their names.

What are we to infer from these facts? Not, say some clergymen, that all the women who make marks are unable to write their names, for they are sometimes so “nervous” that they decline to write, and make crosses. This may be true; but against any women deducted from the ranks of ignorance on this ground must be set a large number of women who write their names so badly, as to prove that they have no command over writing for any useful purpose. Indeed it may be safely affirmed that 58,402, or 32 in 100, is an understatement rather than an overstatement of the number and proportion of young women in England incapable of writing for any practical purpose.

Although nothing has been said by the clergy of the timidity of men, it is probable that in this matter, and on this occasion, the women are as brave as the men, to whom similar remarks are therefore applicable.

In the absence of an educational examination of the whole adult population this test may be employed, and may lead to some practical results.

The annexed Tables display the various shades of ignorance in which large masses of the adult population are still plunged.

TABLE VIII *d.*—SCOTLAND, 1862. Proportion of Men and Women who signed the Marriage Register in Writing.

Divisions.	COUNTIES.	Of 100 Men Married.	Of 100 Women Married.
	SCOTLAND	90·0	79·7
III.	Nairn, Elgin, Banff, Aberdeen, Kincardine	96·5	90·6
VIII.	Roxburgh, Dumfries, Kircudbright, Wigtown	95·3	92·1
VII.	Linlithgow, Edinburgh, Haddington, Berwick, Peebles, Selkirk	94·6	90·3
IV.	Forfar, Perth, Fife, Kinross, Clackmannan	93·6	85·4
I.	Shetland, Orkney, Caithness, Sutherland	92·2	81·3
VI.	Renfrew, Ayr, Lanark	86·5	71·0
V.	Stirling, Dumbarton, Argyll, Bute	86·4	75·7
II.	Ross and Cromarty, Inverness	67·5	50·5

Thus in all the counties around Aberdeen 97 in every 100 marrying men and 91 in every 100 women wrote their names. It is only in the highland counties of Inverness, Ross and Cromarty that the men and women approach or surpass the degree of English ignorance. The old tongue is the same hindrance to the education of the people as it is in Wales.

It should be recollected that the marriageable women of a country are a selected class, and include very few of the infirm, deformed, idiotic, or others incapable of learning. They can nearly all learn to write if they have the opportunity. And upon turning to the Report of Dr. Stark, addressed to the Registrar General of Scotland,* I find that all the women of the county of Kinross who married wrote their names in the registers; the proportions per cent. were also 98 in Peebles, 98 in Kincardine, 96 in Roxburgh, 96 in Kircudbright, 94 in Perth, 92 in Fife, 91 in Edinburgh, and 93 in the far off Orkneys. Under these circumstances he must be an extreme optimist who can contend that the state of education of the women of England is the best possible, when it is found that by the same test in 100 of the marrying women of the county of Bedford only 55 write their names, in Cornwall only 60, in Stafford only 52, in Lancashire 53, in the West Riding only 57, in Durham only 62, in Monmouthshire only 48, in North Wales only 51, and in South Wales only 44.

The women of London come as immigrants in large proportions from every county; 83 in 100 of the brides wrote their names. Middlesex, Surrey, Sussex, Hants, Rutland deserve to be mentioned

TABLE VIII c.—ENGLAND 1864. Proportion of Men and Women who signed the Marriage Register in Writing in the several Counties.

* Eighth Detailed Annual Report of the Registrar General of Scotland—Abstracts of 1862, p. xxiii.

as counties in which 80 or more of 100 brides wrote their names in the registers. In Westmorland 79 women wrote their names; but it is in the education of the men that the Northern Counties approach and even excel, several of the Scotch counties.

Of 100 men marrying, 90 could write their names in Westmorland, 80 in London, 83 in Northumberland, 83 in the East Riding, 81 in the North Riding, 81 in Hants, 81 in Sussex, 80 in Cumberland, 80 in Devon. The proportion then goes on descending deplorably from county to county until it falls to 63 in Bedford, Hertford, and South Wales, 62 in Staffordshire and Monmouth. The excessive ignorance of the colliers of Staffordshire and Wales is a cause of incalculable evils, among others, of explosions, and probably of strikes.

In Scotland we discover a state of things highly creditable to the people of that part of the United Kingdom; and it is difficult to explain the difference in any other way than that in the general struggle for the church property at the Reformation the people had the good sense to endow the schoolmasters with small stipends, and not to give the whole revenue of the land either to the clergy or to the nobility. Between the minister and the lord stood the schoolmaster in the presence of the people. The advantages of the Scotch system of education became so apparent that it was expanded in the period of the civil wars (1646), and firmly established after the Revolution by the celebrated statute of William and Mary in 1696. The endowment was small, and stimulated instead of slackening the exertions of the schoolmaster, who had to depend largely on his own industry, zeal, and popularity for support. M'Culloch estimated the average fixed stipend at 25*l.* 10*s.*, exclusive of

house and garden; the school fees at 2*l.* 10*s.*; the income from all sources at about 6*l.**

It is impossible to say how much Scotland owes to this system of schools, and to the universities, which are accessible to the youth of the kingdom. There was probably as much revenue proportionally devoted to education in England as in Scotland, but the money was in various ways misappropriated, so that before the Reform Bill passed, and even in 1837 when the registration of marriages commenced, the working classes, entirely ousted from the educational charities and universities, were in the most deplorable state of ignorance. *One* in *three* of the young men, and *one* in *two* of the young women, of England could not write their names in the marriage register even in 1841, after some efforts had been made in the cause of popular education.

Happily a considerable improvement is visible in the registers; *one* in *four* of the men, and *one* in *three* of the women, now sign with marks. In twenty-three years the marks-men have fallen from 33 to 23; the marks-women from 49 to 32 in 100.

Still in common education the great body of the people of England are many degrees below the people of Scotland, and it is impossible to calculate the advantage this superiority gives the Scotchman over the Englishman at home and abroad. The education of the common people of Scotland is a benefit to the world; without it Watt could not have invented, Burns could not have written. The brightest boy in a village without a school has no chance of distinction, except by accident.

The success of common education in Scotland speaks well for the working of a rate, mixed with a paying system for children. But before the education of the children of to-day can produce any results on the minds of the marrying fathers and mothers of England, 10 or 15 years may elapse. Cannot nearly all these adults be taught at once to read and write by some simple method? Is there no machinery for grinding reading and writing into the heads of the young agricultural labourers of England who are about to marry within the next five years?

NOTE.—The proportional number of Births registered to Women of all Classes (*Wives, Spinsters, and Widows*) of the ages 20-40 and 15-55 is greater in England than in Scotland, but the proportional numbers of Legitimate Births to Wives and of Illegitimate Births to Spinsters and Widows at the above ages are greater in Scotland than they are in England. The age of the mothers at the birth of their children is unknown in England and Scotland. In Sweden the proportions borne by women of the age 20 and under 40 were 87 per cent. of the total number in the years 1826 to 1835.

Births to a marriage.—The marriages in a calendar year give rise to births which are registered year after year for 20 years. The births to the 167,723 marriages in the year 1859 could only be determined by following the families and counting all the children unto the end. The division of the sum of the children by the marriages would accurately express the fecundity, as it has been called, of marriages. If the annual marriages do not increase or decrease in number through a series of years, the division of the annual births by the annual marriages of the same years expresses the fecundity pretty accurately; but the marriages in England are increasing rapidly; consequently the 740,275 births registered in the year 1864 must be divided by the marriages of some earlier year to get an approximation to the fecundity. As the age of the mothers is unfortunately not recorded, the interval in England is unknown which intervenes between the mean age of marriage and the mean age of the mothers when their children are born; otherwise that interval would indicate the calendar years with which the births of the year 1864 should be compared.

But the interval in Sweden between the mean age of mothers at marriage (25·8 years) and their mean age at the births of their children (31·7) is six years; and the interval in England cannot differ much from six years. Hence, if the legitimate births of given years are divided by the marriages of six years earlier date, the quotient will be the proportion of children to a marriage within close limits. In England the births thus determined to a marriage were 4·255, 4·301, 4·304 in the years 1862, 1863, and 1864. In Scotland the births in 1862 to the average marriages of six years earlier date (1855, 1856, and 1857) were 4·694. The

number of children to a marriage thus appears to be greater in Scotland than in England, and this is held to be a proof that married women are more prolific in Scotland than in England.

Proceeding upon another basis the annual number of legitimate children registered in England was 626,506 in the five years 1856-60; when the average number of wives of the age 15-55, determined directly from the census returns of 1851 and 1861, was 2,843,374; consequently 100 wives bore 22.0 children annually. In like manner it is found that 100 unmarried women bore on an average 1.7 illegitimate children; that is 17 children to 1000 women. 100 women, including the married and the unmarried, bear 12.3 children annually on an average.*

In Scotland, during the same years, the following proportions were found to exist: 100 wives bore 24.8 children annually, 100 spinsters or widows bore 1.9 illegitimate children; and 100 women bore 12.0 children legitimate or illegitimate.

The wives of Scotland, as well as the spinsters, are apparently more prolific than the corresponding classes in England; and yet taken collectively the women of England are more prolific than the women of Scotland. 1000 English women (age 15-55) bear 123 registered children annually; while 1000 Scotch women bear 120 children. The difference is slight, but it is in favour of the English women.

This appears, at first sight, to be contradictory and paradoxical. It is explained by the circumstance that the proportion of recognized wives in the population is much lower in proportion in Scotland than it is in England, and as the fecundity of wives is to that of spinsters as 13 to 1, a slight difference in the proportions alters the birth-rates of the two populations. The difference in this respect between England and Scotland is great: in England 52 in 100 women of the age 15-55 are wives, 48 only are spinsters and widows; in Scotland the proportions are reversedly 44 recognized wives to 56 spinsters and widows.

1856-60.—(1) Wives, (2) Spinsters and Widows, of the Age 15-55 in England and Scotland.

	NUMBER OF MARRIED AND OF UNMARRIED WOMEN.		PROPORTIONAL NUMBER OF MARRIED AND UNMARRIED WOMEN.	
	ENGLAND.	SCOTLAND.	ENGLAND.	SCOTLAND.
Women	5,487,769	867,062	100.00	100.00
Wives	2,843,374	383,271	52.29	44.20
Spinsters and Widows	2,694,395	483,791	47.71	55.80

By altering the proportions in Scotland, for instance, by transferring 57,608 women from the ranks of the unmarried to the married women, and by transferring 2,130 children from the ranks of the illegitimate to the legitimate children, the fecundity of women—of the wives and of the spinsters—of Scotland, becomes the same as the fecundity of the corresponding classes in England, namely, wives having children 22.034 per cent., spinsters and widows 1.676; instead of 24.790 and 1.916 per cent.; and when the transfer is made, the proportions remaining still show a less excess of women living in the state of marriage in Scotland than in England. Let us push this inquiry a little further.

* The proportions are slightly different in the years 1862 and 1864; but the argument remains unaffected. The same remark applies to the proportions of births to women of age 20-40. See Table VIII g.

chased by multiplication of their numbers, uncertain connexions between the sexes, and extensive disorganization of family life.

BIRTHS.

The births of living children in the year 1864 were more numerous than in any previous year; the number registered was 740,275, being 12,858 in excess of the number registered in 1863. The birth-rate was 3.564 per cent. per annum, the highest experienced since the commencement of registration; the rate has steadily increased during the last five years; it was 3.437 in 1860, and 3.461, 3.504, 3.539, and 3.564 in the four following years, the average of the 27 complete years of registration, 1838-64, being 3.342. In 1864 there was one child born alive to every 28 persons living.

As may be expected, the rate of birth varies in different localities; it is lower among the purely agricultural than among the manufacturing and mining populations; in Surrey (*extra-metropolitan*) the rate was 3.112 per cent., in Sussex 3.197, Middlesex (*extra-metropolitan*) 3.130; in Devonshire it was 3.171, while in the neighbouring mining county of Cornwall it was 3.548. Somersetshire had the low rate of 3.112, and Herefordshire, lowest of all, showed only 3.084 per cent. Among the counties experiencing a high birth-rate, Durham ranks first, with 4.298 per cent.; then follow Staffordshire 4.093, West Riding of York 3.966, Lancashire 3.768, Leicestershire 3.762, Northumberland 3.734, and Monmouthshire 3.728. In London the birth-rate (3.480) was as usual lower than that of England generally (3.564), which is probably, to some extent, owing to the large proportion of unmarried persons engaged in

TABLE IX.—Births in the Years 1845-64 in England, distinguishing the Legitimate and Illegitimate.

domestic service and in mercantile and professional pursuits, although no doubt some births escape registration owing to the defect in the English Registration Act, which does not make the registration of births compulsory, as in Scotland and Ireland. No information exists in this country as to the number of still-born children.

Sex.—The births of 377,719 male children and 362,556 female children were registered, being in the proportion of 104·2 males to every 100

but the proportion to the total births is slightly lower, being 6·4 to every 100 births, against 6·5 in 1863. The following counties show the highest proportion of illegitimate births. Norfolk 10·5, Shropshire 9·2, Nottinghamshire 9·2, North Riding of York 9·4, Westmorland 10·5, and Cumberland the maximum rate of 11·8 per cent.

DEATHS.

In 1864 the deaths registered in England were 495,531; and they were more than 20,000 above the number registered in 1863. Twenty years ago the annual number was about 350,000; it is now little short of 500,000. This efflux of human life by the inevitable law of death is a phenomenon as great and impressive in itself as the perpetual growth of the national strength, and the energy with which the people develop their resources, and repair the waste of time and circumstances.

The excess of births over deaths, or the natural increase of population, was 244,744.

The rate of mortality was 2·386 to a hundred persons living, whilst the average for the ten years 1854-63 was 2·213 per cent. It was so high that it slightly exceeded the high rate (2·352) which prevailed when cholera was epidemic in 1854. Under the previous epidemic of 1849 the mortality rose to 2·512 per cent.; and influenza in 1847 raised it to 2·471; but with these exceptions the death-rate of 1864 was higher than any other experienced in the series of years, nearly three decades, to which the national records relate. It was high both in town and country, and through the changing seasons of the year. In three fourths of the whole period the weather was cold, The fall of rain in the year, as observed at Greenwich, was scanty to a remarkable degree, and the motion of the air was less than usual.

Average of 27 years, } 1838-64	2·321	2·140	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·342 deaths of males; to every 100 females living there were 2·146 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females; and that out of equal numbers living the deaths of males were 109 to every 100 deaths of females in 1838.

In the urban districts the mortality was 2.598 against an average of 2.425; in the rural districts it was 2.107 against an average of 1.973. The air was moderately warm in the second quarter; and the country districts experienced the effect of it in that quarter in a mortality but slightly in excess of the average.

In the winter quarter of 1864 the annual rate of mortality in 142 town districts was 30 deaths in a thousand living.

44	North Wales - - - - -	1.863	1.746	1.894	1.988	2.028	2.047	2.235	2.098	2.189	2.171	2.070	2.214

In 1850 there were 48 persons living to one death; in 1856 there were 49; in 1860 and in 1862 there were 47. These are examples of the healthiest years. In 1849 and 1854, epidemic years, the numbers living to one death were only 40 and 43 respectively. Three years of health, 1860, 1861, and 1862, were succeeded by two years, 1863-64, in which the numbers living to one death were only 43 and 42. In 1864 scarlatina, small-pox, and typhus were fatal over the kingdom; and cold, with sudden vicissitudes of temperature, produced bronchitis and pulmonary affections, or gave increased vigour to zymotic and other diseases.

Sex.—The deaths of males in the year were 253,619; and those of females 241,912. In males the rate of mortality was 2·514 per cent.; in females it was 2·264. The average rates are respectively 2·321 and 2·149; hence it appears that the effects of the insalubrity special to the year cumulated more in that which is popularly known as the *stronger* sex than they did in the *weaker*. Greater exposure to the weather, heavier toils under unfavourable circumstances, and more constant communication with the innumerable sources of infection, will account partly for the difference in the results.

For a hundred deaths of females there were 105 deaths of males. But in the actual constitution of the population the female element predominates over the male; and if for better comparison equal populations were taken, say a million males and a million females, there would be, under the ascertained rates of mortality, 111 deaths of males to 100 deaths of females, while taking an average derived from a succession of years the proportion would be 108 to 100.

Place.—The death-rate for England, as has been stated, was 2·386 per cent.; but while this is shown by the Tables to be the rate for the whole kingdom, it may not be precisely that which ruled in any assignable

* For mode of reading this Table, see Note to Table XVII.

NOTE.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841-61.

part of it. Density of population, purity and impurity of earth, water, and air, wealth and poverty, the geological structure of a district,—these and other elements of health and sickness, in their manifold combinations, depressed the mortality in one place, raised it in another. The following rates in different *counties* may be selected, though these, as must be obvious, are derived from populations living each in circumstances almost as diversified as those of the country in its whole extent, and therefore do not furnish the extreme examples that distinguish the busy town from the hamlet. But the differences are nevertheless very considerable in some instances: Westmorland supplied, amongst all the English counties, the best example of healthy condition, the rate of mortality in it having been 1·820; for in the Table, it should be mentioned, the Welsh counties are not distinguished, but are formed in two groups, North and South Wales. The next lowest rate was 1·902 which prevailed in Surrey (exclusive of the Metropolitan portion of it). In that south-eastern corner of England, which lies south of the Thames, the rural division of Surrey holds the best position in sanitary statistics; but Sussex, Hampshire, Berkshire, and the rural part of Kent enjoy fair repute; the rate of mortality rising in none of these counties so high as 2·1. Rutlandshire, Lincolnshire, Suffolk, Dorset-

The Table may be read thus:—Of 100 males living of the age 35 and under 45, 1·358 died in 1838, 1·265 in 1839, and 1·162 in 1850; the average annual rate in the 27 years, 1838-64, among the aggregate of males in this decennial period of age was 1·262.

shire, the North Riding of Yorkshire, these stand as well as the South-eastern Counties.

Much fatal illness had prevailed in Lancashire in 1864, where the death-rate was 2·718 per cent. (the average being 2·580); and it did not in any other county rise as high as 2·700. Monmouthshire and the West Riding of Yorkshire were subject to an equal death-rate, namely, 2·656. In Staffordshire it was 2·518. The average rate of Staffordshire is higher than that of Monmouthshire, which county, as well as Bedfordshire, suffered to a degree much above that which is usually experienced. In the latter county the rate for the year was 2·454.

Of the three counties, Durham, Northumberland, and Cumberland, the last is generally the most healthy; the two former having large populations engaged in mining and other industry. But in 1864 the rate of mortality in Cumberland, with its comparatively small towns, was 2·339 against 2·273 in Northumberland.

Death-rate of males at different ages.—It has been stated that the mortality of males at all ages was 2·514 per cent. in 1864. At some particular ages it was much above that point; at others much below it. The rates at the different ages may be compared with corresponding rates in the quinquennium 1856-60, which was undisturbed by great prevailing epidemics. The mortality of boys who had not reached the close of their fifth year was 7·535 per cent.; the average in 1856-60 was decidedly lower; it was 7·189. At the age 5-10 years it was ·993 against an average of ·833. It was also higher at the age 10-15 years; the results being ·503, average ·464. Again at 15-25 years the rates were ·780 and ·737; at 25-35 years they were 1·075 and ·915; at 35-45 years they were 1·493 and 1·236; at 45-55 years 1·901 and 1·708; at 55-65 years 3·385 and 2·997; at 65-75 years 7·756 and 6·621; at 75-85 years 15·413 and 14·271; at 85-95 years 34·340 and 30·120; and at 95 years and upwards the rate which had been increasing since the age of 15 years, and in the last three decennials with redoubled

speed, rose to 53·246 against the average 42·456. It is thus seen that the mortality of 1864 was high to boys and men at every period of life.

Death-rate of females at different ages.—In like manner if a comparison be made of the deaths of females at the several periods of life in 1864, with those of 1856-60, corresponding results will be observed. The death-rate in 1864 for all ages, 2·264 per cent., was higher than the average 2·100; and in every instance it was also higher as regards particular ages. Taking the extremes of life, the death-rate of girls under 5 years of age was 6·537, the average being 6·257; and that of aged women at 95 years and upwards was 44·851, the average being 41·626. A similar excess, but greater or less in amount, obtained at each intermediate stage.

The death-rates of males exceeded those of females at all the above specified ages, except 10—15 years and 15—25 years, in which periods the latter slightly predominated.

Seasons and meteorology.—The 495,531 deaths in the whole year occurred in the quarters as follows: In the three months ending 31st March, 142,977; in the three months ending 30th June, 116,880; in those ending 30th September, 112,223; and in the last quarter 123,451. The relative influence of the seasons is more readily appreciated, by stating that out of 4000 deaths (giving an average of 1000 for a quarter)

1159 occurred in winter, 949 in spring, 901 in summer, and 991 in autumn. Hence it appears that the cold season asserted its fatal prerogative; and on reference to other years, that it asserted its influence with more than its usual decision. But in all the quarters the mortality was above the average calculated for the several quarters; in the first or winter quarter it was 2.772 per cent., the average being 2.497; in the second quarter (spring) 2.260, average 2.222; in the third quarter (summer) 2.141, average 2.044; and in the last or autumn 2.349, average 2.178.

At Greenwich the mean temperature of the air was *in each* of the first three months below the average; in the two next it was above it; in the sixth below it; in the seventh scarcely above it; and in the remaining five months either below or not above it. In only three months out of the twelve was the mean temperature above the average; and in only one of these three could it be said to have been decidedly above it. Weather of such ungenial mood could not be but destructive of human life; and if it bore the like character all over England, the mortality, which rose till it exceeded by considerably more than a thousand deaths a week the average mortality of the years 1860, 1861, and 1862, may be referred, as regards that excess, to an agent which is as powerful in its nature as it is pervading in its operation. By a reference to the Tables of diseases it will be seen that miasmatic diseases were uncommonly prevalent, and co-operated powerfully with unusual meteorological conditions in raising the mortality.

Besides the requisite degree of warmth, another great sanitary influence was withheld, or was not present in its usual amount. The rain-fall in the year was only 16.8 in. at Greenwich. In the previous fifteen years there was no example of a year of such drought. The annual average in that period was 23 inches. The rain supply was deficient generally through the year, but especially in summer. The humidity of the air was 78 (complete saturation = 100) or 5 below the average. The air was comparatively still; for the mean weekly motion of the air was 1597 miles, which is 97 less than the average.

GREAT BRITAIN.

The population of Great Britain calculated for the middle of the year 1864 was 23,891,009, of which 3,118,701 belonged to Scotland. But although the Scottish population was equal to almost a sixth part of that of England, the marriages in the year were only 22,675, or about an eighth part of the number that took place in the sister kingdom. If the marriage-rate had been as high as that which prevailed south of the Tweed, the number of marriages would have been 27,083. But it was lower; and the persons married were fewer by nearly 9000 than would have been united in wedlock if the constitution of the Scottish population in respect to sex and age, their social condition, habits, and disposition to form families, had been similar to those of the English people.

The North-western Counties, Cheshire and Lancashire, contain a population less by nearly 30,000 than that of Scotland, but in that division

Mean	3.506	3.279	3.209	3.190	2.497	2.222	2.044	2.178

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,033 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

TABLE XXII.—Estimated Population, Marriages, Births, and Deaths in Great Britain, in the Year 1864.

	AREA IN STATUTE ACRES.	Estimated POPULATION in the middle of the Year 1864.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
England and Wales	37,234,283	20,772,208	180,267	309,774	740,275	495,531
Scotland	19,639,277	3,118,701	22,675	45,200	112,445	74,203
GREAT BRITAIN	56,873,560	23,891,009	202,942	406,124	852,720	569,734

the marriages in 1864 were 28,235 (against 22,675 in Scotland). And in London, the population of which is not only less than the Scotch, but less by at least 100,000 than that of the two North-western Counties, the marriages were far more numerous than they were either in the northern kingdom or in the great manufacturing district, having been 31,541.

In England the number of persons married to a hundred living was 1·736; in Scotland 1·454; in Great Britain 1·700.

But though Scotch marriages were few, Scotch births were numerous. The latter were 112,445. The total births registered in Great Britain were 852,720. The birth-rate in Scotland was 3·606 per cent. of the population (as against 3·564 in England).

The deaths in Scotland were 74,303; in Great Britain 569,834. The rate of mortality in Scotland was 2·382 per cent., almost exactly the same as in England (2·386).

FRANCE, AUSTRIA, ITALY, SPAIN.

In France the marriages in 1864 were 294,247; the births 993,188; the deaths 823,185. Persons married (per cent. of the population) were 1·552 against 1·736 in England; the birth-rate was 2·621, the English rate having been 3·564; the death-rate was 2·172, that of England having been 2·386. While in France the public health was much better than

* The returns for France in the years 1861, 1862, 1863, and 1864 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1858-62.

† The returns for Austria exclude Hungary, Croatia, Slavonia, and Transylvania: but the proportions per cent. are estimated to represent the rates prevailing in the entire empire.

In Austria the marriage-rate (1·672 persons married to 100 living) was less than in England (1·736). In the former country both the birth-rate 4·043 per cent., and the death-rate 3·016 per cent. were higher than the respective rates, 3·564 and 2·386 in England. Likewise in Italy the marriage, birth, and death-rates were 1·592, 3·793, and 2·952; being in respect to the first fact less, and in respect to the last two, greater than in England. The Italian rates were all lower than the Austrian.

The Austrian marriage-rate is generally higher than the English marriage-rate; but in 1859 it fell to 1·476 per cent. The Austrian birth and death rates are invariably higher than those in England.

TABLE XXVI.—Italy. Population, Numbers, and Proportions per Cent. of Marriages, Births, and Deaths, exclusive of still-born, in each of the Years 1862 to 1864.

Dr. Maestri, Chief of the Statistical Department of Italy, has favoured the Registrar-General with the facts in the above Table.

NOTE.—The Returns of Births and Deaths in the year 1862 included the still-born, and as no separate return of them was made in that year the numbers returned as still-born in 1863 have been deducted from the Births and Deaths for the year 1862.

In Spain the birth-rate was 3·812 in 1864; the death-rate 3·064. The former was higher, the latter considerably higher than the corresponding rate in England.

TABLE XXIX.—Spain. Population, Numbers and Proportions per Cent. of Births and Deaths in each of the Years 1861 to 1864.

YEARS.	NUMBERS.			PROPORTIONS PER CENT. TO POPULATION.	
	ESTIMATED POPULATION.	BIRTHS.	DEATHS.	BIRTHS.	DEATHS.
1861	15,867,381	611,909	417,764	3·855	2·653
1862	16,044,180	607,962	430,263	3·784	2·682
1863	16,180,680	598,141	461,661	3·667	2·853
1864	16,302,825	621,451	498,486	3·812	3·064

NOTE.—The Population enumerated at the Census of 1860 was 15,873,536. The estimated Population for the Years 1862-4 has been deduced from the Excess of Births over Deaths in each Year. This method of estimating the population is sanctioned by the Junta General de Estadística.

TABLE XXX.—Number of Deaths in the British Army during each of the Years 1861-1864. (Furnished to the Registrar-General by the Adjutant-General by direction of H.R.H. the General Commanding in Chief.)

1863	1·586	1·682
1864	1·735	1·863

THE BRITISH ARMY.

I have been favoured by His Royal Highness the General Commanding-in-Chief with a return of the strength of the Army serving abroad in 1864, and the deaths in it in the same year. The average numbers abroad of cavalry, infantry, artillery, and engineers were of officers 6167, of non-commissioned officers and men 126,040. They were nearly the same as those of the previous year, but an increase on those of 1861-62. The deaths in that strength were, of officers 107, of non-commissioned officers and men 2386. The mortality of the officers was 1·735 per cent.; of the rest of the army 1·893. The former rate was higher than it had been previously since 1859; but the health of the men seems to have

1864	559,599	6,928	1·238

been good, for though the death-rate among them was higher than it had been in 1863, it was lower than in 1862.

In 1861 the entire strength of the army at home and abroad was 229,561 officers and men, of whom 130,469 were natives of England. The Austrian army in that year was 459,300; in 1864 it was 559,599.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

The number of births at sea reported by captains of ships was 380 in 1864; that of deaths was 589. This return does not include the deaths of soldiers, marines, or seamen of the Royal Navy and Merchant service.

The mortality of merchant seamen at sea was 1·99 to 100 living in 1864. The average rate in the 13 years 1852-64 was 1·93.

The deaths of passengers, seamen, and others on board ships, who died from natural causes, or were drowned or otherwise killed at sea in 1864, and which deaths have been reported to me and entered in the Marine Register, are 386. The record, which is exclusive of the returns made to the Registrars General of Scotland and Ireland, is manifestly imperfect. The bodies of persons who have suffered shipwreck and have been washed ashore in England are registered in the districts where they are found.

TABLE XXXV.—Number of Births and Deaths of British* Subjects at Sea, exclusive of Soldiers, Marines, invalided Seamen from the Royal Navy, and Seamen on Ships' Articles, in the Years 1856-1864, reported by the Captains or Commanding Officers of Vessels to the Registrar General of Seamen upon Schedule C., deposited at the Termination of their respective Voyages in Ports of the United Kingdom.—(Furnished to the Registrar General by the Registrar General of Seamen.)

* British subjects are not particularly described upon Schedule C., but foreign names have been excluded from this account.

† The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 69 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, and 96 in 1864. The number is 1043 in nine years, which, if added to the 4106 above, makes 5149, the total number of deaths of British subjects at sea in 1856-64, exclusive of those of merchant seamen.

NAMES ON THE REGISTERS AND SEARCHES.

The names of all children registered as born, of all persons registered as having died, and of all persons married have increased in the accumu-

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar-General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a passenger dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether supposed to be a British subject or Foreigner" might be attempted. British and Foreign seamen are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar-General of Seamen.

1864	8,122,476	16,459,948	11,011,291	35,593,715	8,946

NOTE.—The numbers registered in 1837 are for the Half Year ending December 31st.

lation of $27\frac{1}{2}$ years, from July 1st, 1837, to December 31st, 1864, to 35,593,715. To state the numbers roundly they are about 35,000,000, of which 8,000,000 are names of the married, 16,000,000 those of children born, 11,000,000 those of the dead. The names of persons who have been married twice or oftener in that period, and those of persons whose existence has both begun and ended within the limits of the national registration, are counted more than once. The numbers represent events, not persons.

The searches for registers at the Central Office are yearly increasing; 8346 were made in 1864.

Dr. Farr has addressed to me his usual Report on the Causes of Death in England, which will be found in the Appendix.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

Summary of the Quarterly Reports, 1864.

First Quarter.—January, February, March.

The return exhibits important, and even striking, results in its three-fold variety of subject. The return of marriages is a very satisfactory proof that the bulk of the population was in prosperous circumstances. In the first quarter of the year the marriage-rate is always lower than in any of the three subsequent quarters; but within the range of comparison which the Tables supply, viz., the results of the last ten years, there is no instance of a winter quarter furnishing as high a marriage-rate as that of the March quarter in the present year. The registration of births may be described as "extraordinary," for not only were the births more numerous than they had been at any previous period, but relatively to population they were also numerous beyond example within the last ten years. And in respect to the deaths, a remarkably high rate of mortality attests the severity with which the inclemency of the winter pressed on the public health.

Marriages.—The marriages in the March quarter numbered 37,988. The acceleration of the marriage-rate attained in that period appears by comparing corresponding quarters in 1861-64, in which, using round numbers and a thousand as the unit, the figures run thus: 33, 34, 36, and 38. There was a decided decrease in Devonshire and Cornwall.

The marriage-rate assumed great activity in Yorkshire. In Bradford marriages rose to 499, from 431 and 460 in two previous winter quarters; in Leeds to 496, from 347 and 374; in Sheffield to 506, from 385 and 399.

In Newcastle-on-Tyne they were in the three quarters successively 387, 406, and 443; in Merthyr Tydfil 173, 189, and 260; in Swansea 96, 107, and 127.

The marriage-rate in England and Wales (persons married to population) was 1.472 per cent. against an average of 1.379.

Births.—The total number of births was 192,947 in the first quarter of the present year, of which 26,597 were in London. There was an increase on the number registered in the same period of 1863 in all the Eleven Divisions, except London and the South Western Counties. The number rose in the North Western Counties (Cheshire and Lancashire) from 28,722, to 29,989.

The annual birth-rate in the quarter was 3.74 per cent. against an average of 3.60. It was singularly high; for of results obtained in the previous ten years the highest was 3.72 in the June quarter of 1854. The birth-rate rarely attains so high a point as 3.70 in any quarter, and the average for a year is 3.45.

Increase of Population.—As the births were 192,947, and the deaths were 142,977 in the same time, there was an excess in the former amounting to 49,970, and representing the natural increase of population in the quarter. The Emigration from the *United Kingdom* comprised about 10,923 English people, 2175 Scotch, 24,779 Irish, and 3160 Foreigners, altogether 41,037 persons.

Of the Irish, all, except a section which did not count 3000, went to the United States. Of the English about 6614 persons sought the United States, 3451 the Australian Colonies. The Scotch divided themselves almost equally between those two destinations.

In the March quarter of 1862 the emigrants to the United States were 7210; in that of 1863 they were 24,900; in the same quarter of the present year 32,275. Australia attracted 11,930 persons in the March quarter of 1863, and only 7168 last quarter.

Prices, the Weather, and Pauperism.—Meat more than maintained its price, but both wheat and potatoes were unusually cheap. The mean of the lowest and highest prices of beef as sold at Leadenhall and Newgate was $5\frac{1}{2}d.$ against $5\frac{1}{4}d.$ in the same quarter of the two previous years; and of mutton the mean price was $6\frac{1}{4}d.$, which is also higher than in either of the two corresponding periods. Wheat declined to $40s. 4d.$ per quarter, each period of three months since September 1862 having witnessed more or less fall in the price. From the date just specified the fall has caused a difference of $16s. 6d.$ per quarter. Best potatoes have fallen to a mean price of $6s. 6d.$ per ton at Southwark against double that price in the first three months of last year.

The amount of pauperism and its fluctuation in three successive winters are shown in the following statement. The great severity of the late season has doubtless modified, but happily has not prevented an improvement in the condition of the working classes.

March Quarter		Persons in receipt of	
		In-door Relief	Out-door Relief
1862	- -	143,772	804,268
" "	- -	142,257	943,324
" "	- -	139,606	855,776

It appears in the last Report of the Central Executive Committee for relief of the distressed districts that the number of persons employed in the mills full time has increased from 210,739 in last January to 232,307 in March. The report adds, that a large number returned as "out of work" are in fact "earning considerable though irregular wages on out-door labour." There are some places in which the Relief Committees have suspended their operations without risk to the health of the population; and out of 172 districts reported on, there are only 101 in which voluntary funds are now distributed. Still there are many unions in which the distress of the unemployed has been but "very slightly mitigated."

The mean temperature of the air in the quarter at Greenwich was as low as $37^{\circ}.9$. In the winter quarter of 1862 it was $41^{\circ}.1$; in that of 1863 it was $42^{\circ}.6$. Mr. Glaisher writes that 1863 closed with very fine weather of some weeks' duration all over the country. At the commencement of 1864 the weather completely changed, and was exceedingly cold till the ninth day, the daily defect of temperature being on an average $8\frac{1}{2}^{\circ}$. On the 6th and 7th January the defect was 15° and 13° respectively, and at night the temperature on grass fell to 6° and 7° . The frost was followed by warm, damp, foggy weather. A cold period again set in on 4th February, which lasted a week; snow fell in many parts, and on some days the defect of temperature was 10° . Another warm period succeeded, which continued five days, after which the weather assumed quite a wintry character, with frost, snow, and sleet in all parts of the country. From March 4th to 15th the weather was generally warm, and from that date to the end of the month it was cold. The season was a time of unusual change from frost to thaw, and thaw to frost. The amount of rain in the quarter was 4.4 in. which is slightly below the average.

Deaths; and State of the Public Health.—The deaths greatly exceed the average number. Seldom has a winter been more fatal; for 142,977 deaths, 1571 a day, were registered in ninety-one days, including the additional day of Leap year, for which due correction is made. The mortality was at the rate of 2.772 per cent.; whereas the average of the season in the preceding ten years was 2.490 per cent.; thus the rate was nearly 28 instead of 25 in 1000.

14,698 persons died in excess of the average number.

Since 1842 it is only in the two winters (1847-48) after the potato failure, and in the winter of the Crimean war (1855), that the country

has experienced any higher rates of mortality. The winter death-rate per 1000 was 2·850 and 2·794 in the former years, 2·910 in 1855, and 2·772 in 1864.

In unhealthy places, and in England formerly, when the land was undrained, and when zymotic matter soiled the air and waters more abundantly than it does in these days, the mortality was highest in the hot months of the year; but in the last quarter of a century the summer diseases have to some extent subsided, and left the mortality highest in winter, when the cold weather, in some proportion to its intensity, cuts off the weakly and the aged.

Upon dividing the population into two portions, the one living in the districts comprising the chief towns is found to have experienced the highest rate of mortality, or 2·974 per cent., while the mortality was at the rate of 2·508 in the small towns and in the country districts. The town rate was ·296, the country rate ·228, above their respective averages; thus the increase of the rate was greater in the town than in the country districts.

London suffered to an extraordinary extent, and is accountable for a large share of the increase. The average annual rate of the winter quarter in London is 2·577 per cent., but in the last winter quarter the rate becomes 3·088, or ·511 above the average. The funerals increased in the proportion of five to six.

The mortality of Lancashire and Cheshire is slightly above that of London, but is not so much above its average as the mortality of London.

When the thermometer falls to the freezing point of water, the mortality is raised all over the country; and the population of London is excessively sensitive to cold; thus the corrected average deaths for the second week of January are 1550, but the actual number of registered deaths this year was 2427. The mean temperature of the preceding week, instead of 37°·8, had fallen to 26°·7; and the temperature of one chill night (Thursday, January 7th) had descended to 14°·3, or to 17°·7 below the freezing point of Fahrenheit; and 877 lives were extinguished by "the cold wave of the atmosphere."

The excess of the rate of mortality per cent. during the last winter quarter was ·228 in the country districts and small towns, ·284 in the large town districts, exclusive of London, and ·511 in London, above the average of the quarter.

Fire is a necessary of life in this climate; and a warm hearth mitigates the severity of winter. Fire is as much required by the poor as by the rich; and a tax on coals, like a tax on salt, presses with undue severity on people of small means. Coal at the pit's mouth costs about 5s. a ton; and anything that facilitates its carriage and distribution in cities, by the abolition of duties and monopolies, or by laying down railways, if it lead to a diminution of cost, will preserve many lives that come to an untimely end in such severe weather as has reigned during the last winter months.

The rate of mortality in the South Eastern Division was 18 per cent. higher than it was in the two preceding March quarters; in the Northern Division, where the coal is cheap, the rise in the mortality was only 4 per cent.

Inflammation or congestion of the lungs and the air tubes are the common results of severe cold; and they carried off the aged in great numbers. Scarletina, measles, small-pox, were prevalent and fatal; diphtheria and whooping-cough are also mentioned among the prevalent diseases of some districts. Where these diseases were epidemic, the mortality of districts was high, as the inhabitants suffered from the zymotic poison and from cold.

In the South Eastern Counties, Epsom, Croydon, and Kingston suffered severely; so did the Medway, Faversham, and Dover districts of Kent;

Hastings in Sussex; Portsea Island (small-pox was prevalent): Southampton suffered from measles and the cold; 342 people died in the district which in 1861 had 43,414 inhabitants. The rate of mortality in this rising town was therefore excessive. The mortality was also high in the Reading district and in Windsor. Several of the districts on the north side of London suffered severely from the cold weather; from scarlatina, small-pox, or measles; among them are Hitchin, St. Albans, Watford, and especially Berkhamstead, Amersham, Wycombe, Newport Pagnell, Oxford, Northampton, Peterborough, Leighton Buzzard, Luton, and Wisbech. The mortality in Ely was lower than in the winter of 1862; while in the above districts it ranged from 20 to 148 per cent. above the numbers in the winter of 1862. In Suffolk the deaths were 2211, or 474 more than in the winter of 1862; in Norfolk the numbers in the winters of 1862 and 1864 were nearly equal.

The South Western Counties experienced a high rate of mortality; and the deaths were 11,965 on a population of 1,835,714 in 1861.

The West Midland Counties suffered variously; Staffordshire and Shropshire less proportionally from cold than the neighbouring counties. Wolverhampton, Dudley, and Walsall remain in an unsatisfactory hygienic condition. The deaths in the Birmingham district (the old town) during the three last winters were 1418, 1765, and 1814.

The North Midland Counties experienced a medium rate of mortality; the deaths were 7073 in the winter quarter of 1862, and 8460 in that of 1864. The annual rate in the last winter was 25·84 per 1000.

The rate of the North Western Counties, Cheshire and Lancashire, was 30·97 per 1000. The mortality of the counties which are now suffering from the cotton crisis has always been higher than the mortality of the rest of the kingdom, owing chiefly to the sanitary defects of the towns. Under the Public Works Act which was passed during the last session some of these defects will be remedied. Mr. Rawlinson in his intelligent Report justly says:—"The high death-rate prevailing in Lancashire towns has its main cause in the foul cottage cesspit. An inspection of any town in the district will show this.* The works on which the people are employed at the instance of the local authorities are nearly all of a hygienic character, and cannot fail to be salutary through all future times.

Second Quarter.—April, May, June.

The marriages in the spring quarter were very numerous. The birth-rate was well maintained, although it has been occasionally higher in the same season. The rate of mortality was above the average for the three spring months.

Marriages.—In the three months that ended 30th June the marriages were 44,599. In the same period of 1862 they were 40,853; in that of 1863 the number was 44,146. The increase in the present year is due chiefly to South Wales, Monmouthshire, Yorkshire, Cheshire, Lancashire, and Durham. It was for the most part in the more northern divisions of England.

London returned 7687 marriages in the quarter; the North Western Counties, which comprise Cheshire and Lancashire, and contain a population rather larger than that of the metropolis, returned 7141 marriages. This difference in the results is perhaps less than might be expected in two populations which present much dissimilarity in many and important points of view. The South Eastern Counties and the South Western contain nearly equal populations, that of the latter division being rather less;

* Report of Robert Rawlinson, Esq., C.E., to the President of the Poor Law Board, April 1864.

and their marriage returns also closely agree, the numbers being respectively 3616 and 3577. But though the South Midland Counties have a larger population than the North Midland, the marriages in the former are 2155; those in the latter show a considerably higher number, namely, 2931.

The marriage-rate in the quarter (*viz.*, proportion of persons married to 100 living) was 1.724, against an average of 1.689. In the June quarter of 1860 it rose to 1.766; in that of 1862 it fell to 1.614.

Births.—The birth-rate in the spring quarter (ending 30th June) was 3.65 per cent. per annum, against an average of 3.61. The excess, which is not great, is due almost wholly to the returns of Yorkshire, the Northern Counties, and Wales. In the Eastern Counties and the South Western, to which population is not drawn by a power of attraction equal to that which the great mining districts supply, the birth-rate was not as high as it had been in the two previous corresponding quarters.

The total number of births was 188,835. This is less by about 500 than the number in the same quarter of 1863. In London 25,066 children were born. In the counties of the cotton manufacture, Lancashire and Cheshire, where 30,201 were born, the birth-rate was higher. But the births were not numerous in those counties, if they are compared with former results; and West Derby alone in Lancashire gives indication by its returns of rapid growth in its population.

Increase of Population.—The deaths in the quarter were 116,880; and as the births in the same time were 188,835, there was an excess in the latter amounting to 71,955, which represents the natural increase of population. Immigration of unknown amount would modify the effect of emigration; but the Return of the Emigration Commissioners shows that nearly 20,000 persons of English origin left their native shores for distant settlements in the quarter that ended 30th June. Out of that number nearly 12,000 went to the United States, and 5000 to the Australian Colonies.

The number of emigrants of all nationalities was 86,783, of whom about 66,000, chiefly Irish, were bound to the United States. The emigration to that part of America has not before been so great in the June quarter since 1854. Almost nine-tenths of the Irish emigrants left for the United States.

Prices, the Weather, and Pauperism.—Wheat was unusually cheap. Its average price in the three months was 39s. 7d. per quarter. In the corresponding period of 1862 it was 56s. 8d.; in that of 1863 it was 46s. 2d. The mean of the highest and lowest prices of beef as sold by the carcase in Leadenhall and Newgate was 5½d. per lb., and the same as in the June quarter of last year. Of mutton the mean price was 6½d., being higher than in the same season of 1862–63. The best potatoes were sold from 2l. to 3l. per ton in Southwark. The price was less than half of that for which they had been obtained in the spring of last year, and still lower in proportion to the price of 1862. The working classes enjoyed cheap markets for supplying themselves with the chief necessities of life.

The tables of pauperism exhibit a decline. The quarterly average numbers of poor persons relieved on the last day of each week were as follows:—

		In-door.	Out-door.
June Quarter 1862	- -	127,861	782,113
" " 1863	- -	127,063	873,503
" " 1864	- -	122,883	786,863

After cold and changeable weather at the beginning of the quarter, a warm period set in on the 9th April, and continued for forty-four days with but little interruption. From the close of that period (May 23d)

till the end of June, with the exception of a few days, the weather was cold; and the average defect of mean daily temperature during this last period, consisting of 39 days, was more than two degrees. At the beginning of May rain fell frequently; the cereal crops improved and looked healthy. In June the wind blew from the east; there was a deficiency of rain, and generally the weather was not good for agricultural purposes. The degree of humidity in the quarter was 73, which is 4 below the average. The air was uniformly dry, for the humidity was below its average in each of the three months.

The mean temperature of the air at Greenwich was $53 \cdot 1^{\circ}$, which is above the average. In April and May it was in excess; in June it was in defect.

The fall of rain was less than the average in each month, and the whole amount did not exceed $3 \cdot 5$ inches.

Deaths; and State of the Public Health.—The deaths which were registered in the quarter that ended on June 30th amounted to 116,880. This number is above the average of the deaths in the months of April, May, and June; but it is less than the number of deaths which were registered in the corresponding quarter of the previous year, and less by 26,097 than the deaths in the three first fatal winter months of this year. Then 1571 deaths were registered daily; in the present quarter the daily deaths have been 1284. The mortality has been at the rate of $2 \cdot 260$ in 100 living, or $\cdot 073$ above the average of the spring quarters of the previous ten years. The mortality of the town populations has been at the rate of $2 \cdot 369$, and of the country populations $2 \cdot 110$ per cent.: thus the towns lost 18,392 lives, and the country 10,000 lives, in excess of the deaths which would have been registered had the mortality been at the rate prevailing in the least unhealthy districts of England and Wales.

As a general rule the three spring months April, May, June are healthier than winter, and somewhat less healthy than the summer in ordinary years. They express very closely the average mortality of the year. Thus the average annual mortality per cent. in ten years (1854–63) was $2 \cdot 214$, and in the ten springs of those years $2 \cdot 187$; it was less in the spring quarters by $\cdot 027$.

If we divide England and Wales into eleven great divisions, their prevailing mortality is found to differ. The country south of the Thames is the healthiest, and in general the deaths do not exceed 20 in 1000. Kent, Surrey, Sussex, Hampshire, and Berkshire constitute the South Eastern Division, where the mortality has been below its ordinary favourable average; for the annual rate prevailing in the quarter did not exceed $19 \cdot 41$ per 1000. Yet in some districts of Kent the deaths exceeded those in the corresponding quarters of the two previous years; this was the case in Bromley, Dartford, Tunbridge, East Ashford, Eastry, and Dover. Scarlatina prevailed in Maidstone. Hampshire and Berkshire were healthy.

The mortality of the South Western Division has been at the rate of $20 \cdot 96$, which is considerably higher than its average. The great epidemic of scarlatina which prevailed in England for some years subsided in 1861, but broke out again in 1862, and has since prevailed in various parts of the country with severity. Wiltshire and Somersetshire, and especially the districts around Bath and Bristol, continue still to experience its inflictions: the mortality was considerably above the average in Clifton, Bath, Clutton, Wellington, Chard, and Yeovil. These important districts might probably learn something useful from their venerable neighbour Salisbury, where the mortality continues low, and justifies the sanguine expectations of its sanitary reformers.

The mortality of the Eastern and of the South Midland Divisions was above the average; and among the unhealthy districts Uxbridge, Amersham, Eton, Bedford, Luton, and Wisbech may be named.

The people of the West Midland Counties died off at the rate of 22·32 in 1000; and this is slightly below their average rate.

The North Midland rate was 21·45; which is higher than its average.

The mortality of the North Western Division, including Cheshire and Lancashire, was 24·76; which is ·75 below its annual average mortality in the preceding ten years. The people of these counties might be rendered as healthy as the people of any other counties, by the application of the legitimate machinery for the purpose.

While the mortality of Lancashire is decreasing the mortality of Yorkshire is rising, and in the last spring months the people of the greatest county of England, which has often taken the lead of other counties on great occasions, very nearly surpassed Lancashire in its rate of destruction. The people died off at the rate of 24·55 in 1000; which was 1·46 above its high average rate. It would seem that no earnest efforts are made to secure the blessings of health in the prosperous towns of Yorkshire, where there is no lack of medical and engineering skill, and still less lack of enterprize or public spirit. The same temper which has exposed their valleys to the inundation of badly constructed reservoirs has left their towns exposed to the deadlier ravages of fevers, and of zymotic diseases of all forms. It is time that the men of Yorkshire should awake from their slumbers, when the tide of mortality is rising so rapidly and so threateningly.

It is a singular circumstance, that the mortality often augments with the increased prosperity of a district; and this is curiously illustrated by Ulverston, a romantic district extending from Morecambe Bay to Lake Windermere. Ulverston, in the ten years, 1841-50, was one of the healthiest districts of England; the mortality did not exceed 18 in 1000. A change took place, and in the ten years 1851-60 the mortality rose to 20 in 1000. The deaths in the last quarter were considerably above the average of previous years, caused, says one of the registrars, "in part by the increase of the population, and in part by the prevalence of scarlatina and measles." He adds: "but there is no distress; work is plentiful, wages good, and provisions cheap. Labourers are earning 3s. 6d. a day; artisans 4s. 3d. and upwards."

The population of many of the townships and parishes of the Ulverston district, at the feet of its fells, and round the shores of its meres, is stationary, and in some instances has declined: it is an old iron district, which had seen its works decay when coal came into use for smelting, but of late a pure hæmatite ore has been discovered in the carboniferous limestone of Dalton-in-Furness, for which there is a great demand. The population of the parish rose from 4683 to 9152 in the interval of the two last censuses, and, with the parishes in its vicinity, gave the increase which raised the population of Ulverston district from 30,556 in 1851 to 35,738 in 1861.

The mortality of the district of Ulverston, exclusive of Dalton, in the two last quarters, was at the rate of 26 and 23 in 1000; while that of Dalton was at the rate of 42 and 31; and it is in this sub-district that the spectacle is presented of "work plentiful, wages good, provisions cheap," and "the prevalence of destructive epidemics." This coincidence is reproduced over and over again. And it must not be supposed on that account that work, good wages, and cheap provisions are in themselves bad things; for they are as salutary as they are attractive to the masses of mankind. But our industrial armies are cut down by the camp diseases which are generated by the inadequate house accommodation, and by the want of sanitary arrangements, which are never carried out in the neighbourhood of new works. Impure water, impure air, their own exhalations, kill men, women, and children on the spot, and breed the leaven which devastates the towns and valleys in the vicinity. For the sins of a parish are often visited on its neighbours in thousands round.

Thus South Wales has been rendered prosperous by the mines, and unhealthy by the negligence of the people. The mining population appears to be even less careful of life than the manufacturing population.

The same causes which render new works unhealthy tend to destroy the natural advantages of watering places, to which the people living in cities resort for relaxation and in search of health. The drainage is costly, and its expense is postponed or evaded to the last moment, as it is at first doubtful whether the world will continue to resort to places which have often no natural advantages over others, and are selected, like some of the insalubrious German watering places, by mere accident.

Nearly all the English watering places are on good sites, and have many advantages over those abroad, and there can be no doubt that ultimately England will be the resort of foreigners who are in search of health, when we find a mortality-rate per 1000 so low as 15 in the Isle of Wight, 16 in Newton Abbot including Torquay, 17 in Cheltenham, 17 in Eastbourne, 18 in Worthing, 18 in Barnstaple, including Ilfracombe, 18 in Mutford, including Lowestoft.

The Brighton rate of mortality is 20 in 1000; but there is good reason for believing that it might be reduced to as low a rate as prevails at Cheltenham or Worthing, at a cost which would certainly be returned by its surer tenure of the public favour. Some of the seaside towns are draining their houses, and for this they deserve applause; but it appears to be very unreasonable to throw into the waters of the sea where visitors bathe the offensive matters which would fertilize the disinfecting chalk soils in the surrounding fields.

Why is the mortality of the Isle of Thanet, including Ramsgate and Margate, still 23? Why is the mortality of Hastings 24? Why is the mortality of Clifton 24? Why is it in Yarmouth at the rate of 25 in 1000?

Mortality in the Districts containing some of the principal English Watering Places.

Third Quarter.—July, August, September.

The weddings in the summer were much more numerous than they had ever been in the season. The births rose in a still more remarkable degree. The aspect of the returns was less satisfactory as regards the deaths, the number of which was greater than any previous summer number, except that of 1863, since the period of the last great cholera epidemic. The same statement is applicable to the deaths considered relatively to the population, as it was estimated for the successive summer quarters in which the deaths occurred.

Marriages.—The marriage of 89,350 persons is recorded in the quarter ending 30th September 1864, the number of marriages being 44,675 or 2743 in excess of the same quarter in 1863. The rate was 1·704 per cent., which is considerably above the average (1·597 per cent.), and is the highest rate that has been attained in any corresponding quarter, excepting in the September quarter of 1853, when the rate reached a maximum point of 1·718 per cent. The increase in the number of marriages, which presented itself so conspicuously after the bountiful harvest of 1863, has since been continuous, and points to the improved condition of the bulk of the population. Compared with the same quarter of 1863, the marriages in London increased from 8029 to 8581, in Staffordshire from 1698 to 1831, in Warwickshire from 1152 to 1289, in Cheshire from 910 to 1063, in Lancashire from 6091 to 6534, in West Riding of Yorkshire from 3467 to 3803, in Durham from 1100 to 1241, and in Glamorganshire (including Merthyr Tydfil) from 749 to 915. The marriages were stationary in North Wales, and decreased in Hertfordshire, Buckinghamshire, Oxfordshire, Dorsetshire, Cornwall, Herefordshire, and Shropshire.

Births.—In the quarter that ended 30th September, 181,015 children were born, a number which exceeds that of the same period in 1862 by about 8000, and that of 1863 by nearly the same amount. All the Eleven Divisions contributed to the increase. In London the births were 25,285; in Cheshire and Lancashire 28,187. In the South Midland Counties they were 10,830; in the North Midland, with a less population, they were 11,323.

The births in Islington were 1531, and those in Kensington were almost exactly the same number; but in 1861 the population of the former district was 155,000, while that of the latter was 186,000. Apparently the facts may be accepted as an indication of the rapid growth of building and population in Islington. The most populous of all the London districts is Pancras, in which about 200,000 persons are now living; and in the quarter it placed 1842 births on the registers. The district of Marylebone returned 1241 births, almost the same number as Halifax in Yorkshire, which, however, contained at the census a population less by 32,000 than the metropolitan district.

The birth-rate was 3·45 per cent., against an average of 3·31. This result is very remarkable, for in the ten years 1854–63 there is no example of the birth-rate attaining a point as high as 3·4 per cent. in the summer quarter.

Increase of Population.—The deaths in the quarter ending 30th September were 112,223; and as the births in the same time were 181,015, the natural increase of the population was 68,792. People died at the rate of 1220 daily; 1968 children were born daily; and if the result were not continually subject to modification by immigration and emigration, the population would be augmented daily by 748 persons.

The number of emigrants in the quarter who left ports in the United Kingdom where emigration officers are stationed was 46,467. The emigration, not only to the United States, but to all parts of the world, was less

by nearly 12,000 than it had been in the same quarter of last year. To the United States there went 28,853 persons, and to the Australian Colonies 11,241. Less than a fourth part of the emigration to the United States was of English origin; the Irish element constituted more than a half; Scotchmen and foreigners the remainder. The number that embarked at Liverpool, and which included persons of various origin, was to that which sailed from all other ports in the proportion of 27 to 19.

Prices, Pauperism, and the Weather.—The average price of consols was as low as 89½. The price of wheat was 42s. 3d. per quarter, which is less than it was in the September quarter of 1863, and less by 14s. 7d. than it was in that of 1862. But beef and mutton showed no disposition to fall; and best potatoes at the Waterside Market, Southwark, were 5l. per ton, and were dearer than in the summer of 1863.

Pauperism declined in the quarter, as the following numbers will show:—

				In-door.	Out-door.
In the September quarter of 1862 the average number of persons relieved on the last day of each week				—	—
-	-	-	-	119,600	789,917
Ditto	ditto	1863	-	120,343	817,238
Ditto	ditto	1864	-	116,198	740,210

During the thirty-nine days which closed the spring quarter the weather was cold, and it continued cold for the first sixteen days of July. A warm period then set in, and lasted twenty-five days; but again a cold period, extending from the 9th to the 28th of August, succeeded, during which, though the days were warm, the nights were very cold, almost to frost. Thereafter, warmth alternated with cold till the end of September.

The most remarkable feature in the meteorology of the quarter is the low degree of humidity of the air in August; it was only 65, the average being 77, and saturation being represented by 100. There is no previous instance on record of a humidity in August less than 69. In that month the weight of vapour in a cubic foot of air was only 3·7 grains, which is one grain less than the average. This furnishes the only known instance of vapour being less than 4·3 grains in August.

The mean temperature of the air in the quarter was 59°·4, which is slightly below the average. The pressure of the atmosphere was in excess in July and August, and slightly in defect in September. The rain-fall amounted to 4·5 in. in the three months, viz., 0·3 in. in July, the average being 2·7 in.; 1·4 in. in August, the average being 2·4 in.; and 2·8 in. in September, the average being 2·4 in. The whole quantity was 3 in. below the average.

In one instance only, viz. in 1847, has the fall of rain from the beginning of the year to the end of September been smaller in amount than it has been this year.

And if the period of twenty-one months ending 30th September is adopted as the basis of comparison, it will be found that the period which terminated on that date in the present year is the driest on record.

Mr. Glaisher, from whose remarks on the Greenwich observations the above facts are derived, adds: "The season was remarkable for its great dryness, particularly in August; for its ranges of temperature in that month, which extended in many inland places to 50°; and for its cold nights. Pastures were mostly bare at the end of that time; many ponds and wells dried up, and water sold in many places from 1d. to 3d. per bucket."

Deaths; and State of Public Health.—The deaths registered in the quarter were 112,223, of which 18,272 occurred in London; 13,829 in the West Midland Counties, which include Gloucestershire, Herefordshire, Shropshire, Staffordshire, Worcestershire, Warwickshire; 18,157 in

Cheshire and Lancashire; 12,430 in Yorkshire. Those four divisions are the most important, in respect to population, of the eleven groups of counties or parts of counties into which England and Wales are divided with a view to a general comparison of the returns.

The total number of deaths was almost the same as that of the September quarter of last year, but considerably more than in that of 1862. But though the last two summer quarters present the same aggregate result, they do not exhibit the same uniformity in detail. The returns of the late summer, as compared with those of 1863, are heavier in London, the West Midland Counties, Monmouthshire, and Wales; lighter in the North Western Counties, Yorkshire, Durham, Northumberland, Cumberland, and generally in other parts of England. In Suffolk the deaths declined from 1847 to 1425; in Cornwall from 2036 to 1684; in Gloucestershire from 2585 to 2263; in Lincolnshire from 1951 to 1766.

The annual rate of mortality for the quarter in England and Wales was 2·141 per cent., against 2·000 as the average. With the exception of the summer of last year, the death-rate was higher than in any previous corresponding season since the cholera summer of 1854.

The causes which operated to produce this excess were not confined to cities, but attacked town and country, and raised the deaths in both, in equal amounts, above their respective averages. The town and country rates of mortality were 2·374 and 1·831 per cent., against their averages 2·253 and 1·713.

The mortality is lowest in the summer quarter. This rule holds invariably in England in ordinary seasons, and only fails to assert itself when malignant cholera, favoured by the heat of summer, rages over the country. But it is matter of interest to notice in the above table, that while it obtained as usual in ten of the great divisions of the kingdom, the rule did not hold good in London, where the mortality of the summer quarter was 2·406 per cent., and exceeded that of the preceding spring, when it was 2·353. The undue prevalence of diarrhoea or English cholera in London, from whatever cause it may arise, has made summer more fatal to children than spring. The deaths from that disorder last quarter in the metropolis were 2210; and in the ten years 1851-60 it was much more fatal there than in any other Division except the North Western Counties, Cheshire and Lancashire. The districts of the cotton manufacture have suffered greatly in former times from the complaint in question; and it may perhaps be accepted as a symptom of comparative exemption from it, and of improved sanitary condition, that the mortality per cent. was 2·322, against 2·476 in the spring months. Lancashire was at least as healthy as Yorkshire, in which the mortality of last summer was 2·366.

The healthiest of all the Divisions was the South Western Counties (Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire), in which the death-rate was 1·820. It was but slightly higher (1·866) in the south eastern portion of the island, or that which lies south of the Thames. From its minimum it ranged over the country, through various gradations, to its maximum, which was 2·406, and which prevailed in London.

It may be presumed that emigration from the North Western Counties during the continued depression of their staple industry has confined the registration of deaths in those parts within narrower limits than it would otherwise have attained. That cause has no doubt had its effect; but the fact that the registration of births, simultaneously conducted, was not inactive, proves that it did not operate to an important extent.

The summer quarter of 1860 was distinguished by its wet, its cold, its want of sunshine, and generally by what is known as "bad weather;" it was distinguished also by a singularly low rate of mortality. In each month the mean temperature of the air was four degrees below its average,

and ten inches of rain fell. In the summer of the present year the monthly temperatures were near their averages ; the amount of rain was less than five inches ; and extremes of diurnal temperature were suffered, which had not been experienced in 1860. This brief statement of differences of meteorological constitution in the two seasons probably does not embrace all the influences that were at work ; and when the records of the two entire years are completed, both for England and Scotland, an examination of the facts in more detail will be instructive ; but the main result has been ascertained, and is sufficiently striking, namely, that under a higher but less uniform temperature, and an unusual defect of humidity, the deaths of last summer, which were 112,223, would have been only 89,336 under the rate of mortality that prevailed in 1860 ; and therefore 22,887 deaths occurred in England which would not have occurred if the season in all its circumstances had been as favourable to health as the summer of 1860.

The Registrars have in some cases mentioned the complaints that were most fatal in their districts, and facts in connexion with them which had fallen under their notice casually or in course of professional duties. Their notes show that scarlatina was the prevailing type of disease ; that it visited many parts of the country, both north and south, and not a few with much severity. It prevailed in Aldershot, and in the Camp there ; of 72 deaths in All Saints, sub-district of Hastings, nearly the half was from scarlatina ; and almost half of the mortality in Horsham, North sub-district, was from the same cause ; it prevailed in Petworth ; and in Faringdon, where 26 out of 46 deaths were from scarlatina. It caused nearly a third of the total deaths in Hitchin, and more than half of those in the parish of Witney, and 54 out of 193 deaths in the sub-district of St. Giles, Northampton. It prevailed in Dunstable and Luton ; and in the latter was fatal in 44 cases, the deaths from all causes being 180. Diphtheria prevailed at Flegg in Norfolk, where houses are overcrowded and drainage defective, and at Stratton ; scarlatina in Eynsford, where a third part of the 74 deaths was due to it ; also in the district of Walsingham. Twenty-two out of the 54 deaths in Brixham, Devonshire, were from the same disease ; and at Tavistock it caused no less than 111 out of 179 deaths. It caused half of the mortality at North Hill, Launceston ; 20 out of 43 deaths at Dulverton in Somersetshire ; it was fatal at Bath and other parts of the same county. Eleven out of 22 deaths were from scarlatina in the sub-district of Bromyard, Herefordshire. The Dudley district in Staffordshire suffered severely both from small-pox and scarlatina, each of those diseases having caused 59 deaths at Rowley Regis, and each of them 45 at Tipton. Out of 90 deaths in Halesowen (Stourbridge), 34 were from scarlatina. In Lincolnshire, diphtheria prevailed at Tetford ; scarlatina in Lincoln, Great Grimsby, and the parish of Caistor. In Prescot (Lancashire) it prevailed much ; out of 349 deaths in St. Helen's, in that district, 105 having been from scarlatina. It caused 58 out of 148 deaths in the sub-district of Newchurch (Haslingden), and 33 out of 86 in Ulverston. But though it was common in many parts of the same county, it was perhaps not so prevalent and fatal as diarrhœa, which in summer abounds in the cotton districts. In Yorkshire, Todmorden, Huddersfield, Halifax, and Bradford, all suffered much from scarlatina. But it appears to have been almost entirely absent from Sheffield, where diarrhœa predominated over other complaints. Blaenavon (Abergavenny) and Newport in Monmouthshire ; Merthyr Tydfil, Neath, Swansea, and other parts of Wales, had a sharp attack of scarlatina. This review of the local reports is rapid and imperfect, but it seems to indicate that scarlatina was most fatal in the south ; diarrhœa more, or at least equally, fatal in some northern districts.

Small-pox attacked Alverstoke, Liskeard, Clifton, Wolverhampton, West Bromwich, Dudley, Stourbridge, Worcester, Birmingham, Coventry, Dud-

deston (Aston), Shipston-on-Stour, the parish of Blaby, where 18 deaths occurred from it, Leicester, Runcorn, Chester, Liverpool, Prescott, Thornton (Bradford), Wortley (Kirkstall), Sheffield, Scarborough, Yarm (Stockton), Easington, Berwick, and Neath. It is stated that "there is no medical officer of health in Birmingham, and vaccination is greatly neglected."

Glendale in Northumberland is a model district in statistical tables; with Farnborough, Bellingham, and Rothbury, it stands a monument of salubrity, to which a sanitarian immediately turns, when he seeks a comparison or would direct an aim. In the ten years 1851-60, the average mortality of Glendale was only 15 deaths to 1000 living. But the Registrar of Ford, one of its sub-districts, gives in his report a striking example of the natural advantages of a situation defeated by the apathy or ignorance of its inhabitants. When a village community abuses the patrimony which heaven has bestowed, and begins to suffer the effects, it is well if the minister, the surgeon, or other intelligent monitor will step in to warn and advise. The Registrar writes:—"The village of Lowick has been for some months heavily afflicted with typhoid fever, arising from its imperfect sanitary condition, there being no drainage to convey the stagnant water and other noxious matter from the place."

TABLE I.—Annual Rate of Mortality per Cent. in Town and Country Districts of England in each Quarter of the Years 1854-1864.

AREA in Statute Acres.	POPULATION enumerated.		Quarters ending	ANNUAL RATE OF MORTALITY per Cent. in each Quarter of the Years

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Districts of London: Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge; West and East Maidstone Sub-districts (Maldstone); Canterbury; Minter Sub-district (Sheppey); Thanet, Dover, Hastings, Brighton; Shoreham Sub-district (Steyning); Portsea Island, Alverstoke, Southampton; Winchester Sub-district (Winchester); Reading, Brentford, Edmonton; St. Clement Sub-district (Headington); Oxford, Northampton; Peterborough Sub-district (Peterborough); Bedford and Kempston, and Bedford and Cardington Sub-districts (Bedford); Luton Sub-district (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salisbury; Weymouth Sub-district (Weymouth); Exeter; Torquay Sub-district (Newton Abbot); Plymouth, East Stonehouse, Stoke Damerel, Truro, Redruth; St. Mary Magdalen and St. James Sub-districts (Naunton); Bridgwater Sub-district (Bridgwater); Bath; Badminton Sub-district (Badminton); Bristol, Clifton; St. Nicholas and St. John Baptist Sub-districts (Gloucester); Cheltenham; Hereford City Sub-district (Hereford); Madeley, Shrewsbury; Stafford Sub-district (Stafford); Newcastle-under-Lyme Sub-district (Newcastle-under-Lyme); Wolstanton, Stoke-upon-Trent; Burton-on-Trent Sub-district (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; Kidderminster and Lower Norton Sub-districts (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; Loughborough Sub-district (Loughborough); Leicester; Boston Sub-district (Boston); Lincoln Home Sub-district (Lincoln); Great Grimsby Sub-district (Caistor); Radford, Nottingham; Newark Sub-district (Newark); Derby, Hayfield, Stockport; East and West Macclesfield and Sutton Sub-districts (Macclesfield); Runcorn Sub-district (Runcorn); Congleton Sub-district (Congleton); Chester Castle and Chester Cathedral Sub-districts (Great Boughton); Birkenhead, Liverpool, West Derby, Prescott, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; Chorley Sub-district (Chorley); Preston; Lancaster Sub-district (Lancaster); Kelsley, Todmorden, Huddersfield, Halifax, Bradford, Kirkstall, Hunslet, Holbeck, Bramley, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; Doncaster Sub-district (Doncaster); Southam, Mickleton, and Walmote Sub-districts (York), Seacroft, Hull; Scarborough Sub-district (Scarborough); Darlington Sub-district (Darlington); Stockton, Hartlepool; St. Oswald and St. Nicholas Sub-districts (Durham); Honehton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon-Tyne, Tynemouth; St. Cuthbert and St. Mary Sub-districts (Carlisle); Whitehaven Sub-district (Whitehaven); Kendal Sub-district (Kendal); Newport Sub-district (Newport); Cardiff Sub-district (Cardiff); Merthyr Tydfil; Llangaflock and Swansea Sub-districts (Swansea); Llanelly Sub-district (Llanelly); Pembroke Sub-district (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 92 days; each of the last two quarters of the year, 93 days. For this inequality a correction has been made in the calculations, also for the difference between 365 and 365.25 days, and 366 and 366.25 days in leap year.

" It contains between 600 and 700 inhabitants, and there is scarcely a house in which there is not sickness; in some houses there are two and three, and even four cases in a family; and there have been two or three deaths from this cause. It is also ill supplied with water; at all times the water is objectionable as to quality, but for these last three months it has been very deficient in quantity; and the inhabitants are suffering much, both from the impurity and insufficiency of that first necessary of life."

TABLE 2. — The Average Prices of Consols, of Wheat, of Meat, and Potatoes, in each of the Years and in each Quarter of the Years 1856-1864; and also the Average Number of Paupers relieved on the last day of each Week, in each of the Years and in each Quarter of the Years 1857-1864.

It was remarked in last report that "South Wales had been rendered prosperous by the mines, and unhealthy by the negligence of the people;" and reference was made to the "want of those sanitary arrangements which are never carried out in the neighbourhood of great works." Neath furnishes a case in point, for the Registrar says:—"The deaths in this quarter are much above the average of corresponding quarters in the last five years. This is due in some degree to increase of population consequent on the erection of large works in the district, and also to a large number of deaths from scarlatina and small-pox, which occurred chiefly in an overcrowded and ill-drained locality in this town and in the neighbouring village of Britonferry." In All Saints Cemetery, Newcastle-on-Tyne, 521 interments of children reported still-born have taken place within the last seven years. The

non-registration of the still-born is mentioned by the Registrar as subject of regret. He thinks they should not be interred without a Coroner's order or Registrar's certificate.

Fourth Quarter.—October, November, December.

The population goes on increasing. The marriages in the last quarter of the year were numerous even for the Christmas season. The births were less numerous than in the corresponding quarter of 1863; but with that exception the number is higher than it has ever been since registration began. Death has unhappily also been unusually busy. No autumn death-rate has been observed in England higher than that of the last quarter, excepting in 1846, 1847, and 1858. Bread has been cheap,

in the Year 1864. By JAMES GLAISHER, Esq., F.R.S.

and employment, except in Lancashire, plentiful; but the weather has been cold, and the waters of the wells and streams have been scanty, as well as impure, through the deficiency of rain-fall; of which the storage about dwelling houses is everywhere deficient. Fever and scarlatina have ravaged several cities where the sanitary arrangements have never yet reached the great body of the population.

Marriages.—The number of weddings in the three months ending 31st December was 53,125, or on an average 577 daily. It was greater than in any previous quarter. In London it rose from 7811 and 7856 in the corresponding quarter of the two previous years to 8711. The West Riding of Yorkshire, Durham, Northumberland, and South Wales also showed by a clear increase in their marriages that the times were prosperous with them.

In Lancashire the marriages which were 6499 in the last quarter of 1863 decreased to 6157 in that of 1864; but they were considerably more numerous than in the same period of 1862.

The annual marriage-rate of the fourth quarter was 2.022, against an average rate of 1.963; in the ten years 1855-64 there is only one instance of a higher rate (2.026) which occurred in 1859.

Births.—The births of 177,478 children (90,260 boys and 87,218 girls) were registered during the quarter ending 31st December, a number which, although above the average of the season, is less by 819 than that registered in the last quarter of 1863: the decrease is spread over many of the counties, but in the following the births are in excess of those in the corresponding season of 1863: Surrey, Kent, and Middlesex (extra-metropolitan), Cambridgeshire, Suffolk, Norfolk, Dorsetshire, Herefordshire, Shropshire, Staffordshire, Worcestershire, Rutland, Durham, Westmorland, Monmouthshire, and South Wales. The birth-rate was 3.38 per cent. against 3.46 in 1863, the average being 3.27.

Increase of Population.—177,478 births were registered in the quarter ending 31st December, and there were 123,451 deaths during the same period, leaving a natural increase of 54,027 to the population, or 587 daily.

The number of emigrants in the quarter who left ports in the United Kingdom where emigration officers are stationed was 33,495, being 12,972 less than in the previous quarter, and 9628 less than in the same quarter of 1863.

12,192 of the emigrants were of English origin, of whom 4905 sailed for the United States, 335 to the North American Colonies, 5529 to the Australian Colonies, and 1423 to other places.

the 13th December the weather was generally warm, but there were cold periods of two and three days together; but upon the whole there was an excess of temperature averaging $2\frac{1}{2}^{\circ}$ daily. From the 14th December to the end of the quarter the weather was changeable. On the 17th the deficiency of temperature was as large as $15\frac{3}{4}^{\circ}$, and on the 20th there was an excess of 3° , followed again by a considerable deficiency, which generally prevailed; and the average defect of temperature from the 14th to the end of the month was nearly 4° daily. The mean temperature of the quarter at Greenwich was $43\cdot7^{\circ}$.

The fall of rain was in defect to the amount of 1·7 in. in October, slightly above the average in November, and showed a deficiency of 1·3 in. in December. The amounts fallen are respectively 1·1 in., 2·6 in., and 0·6 in.

Deaths, and State of the Public Health—123,451 deaths (63,117 males and 60,334 females), were registered in the last 92 days of the year, a number never yet reached in any corresponding season since the commencement of registration. The rate of mortality during the quarter was 2·349 per cent.; this high rate has only been exceeded in the autumn season on three occasions, namely, in 1846 when it was as high as 2·545 per cent., in 1847 when it reached 2·389 per cent., and in 1858 when it attained 2·406 per cent.; the average of ten corresponding quarters was 2·180 per cent. This excessive mortality deserves serious attention and thorough investigation; and it may be expected that the corporate bodies of the kingdom will be alive to the necessity of improving the sanitary condition of our towns, and of appointing medical officers of health, whose duty it will be to watch and keep the public informed of the state of health, to trace the progress and causes of the epidemics which periodically ravage our densely populated districts, and to suggest promptly the best means of bringing them into a healthy condition. The excess in the rate of mortality is spread over nearly all the Divisions of England and Wales. In LONDON the deaths were 19,788 against 17,732 in the same season of 1863. Many districts in the SOUTH EASTERN COUNTIES shared in the high rate of mortality, and suffered from scarlatina, although in other districts, including the Isle of Wight, the deaths were below the average. The Tables show that most of the districts of the SOUTH MIDLAND COUNTIES were in an unhealthy state, and the same may be said of the EASTERN COUNTIES, particularly Norfolk; Norwich returns 572 deaths against 419 in the same period of 1863; Yarmouth has 233 against 195 in 1863 and 174 in 1862. In the SOUTH WESTERN COUNTIES, scarlatina was very fatal, causing 18 out of 45 deaths in the sub-district of St. Thomas, 23 out of 60 deaths in the Brixham sub-district of Totnes, 28 deaths in the sub-district of Tavistock, 19 out of 38 deaths in the Wiveliscombe

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1859.

sub-district of Wellington. 17 out of 61 deaths in the Yeovil sub-district were caused by scarlatina, and the drainage of the town is represented as being in a very bad state. The Registrar of the Lansdowne sub-district of Bath says :—

17 deaths have been registered from scarlatina, 3 from small-pox, one from measles, and one from diphtheria. Scarlatina still continues to prevail in this district. Better sanitary arrangements are required for the whole of the lower parts of the city, together with a better water supply, and an unpolluted river, freed from sewage.

The districts of the WEST MIDLAND COUNTIES have suffered severely from small-pox; scarlatina and typhus were also very fatal. In Clifton sub-district 29 deaths were from small-pox; in Leominster sub-district 26 out of 56 were from the same disease; in St. Mary, Shrewsbury, this disease was fatal in 20 instances; in the Wellington sub-district in 13; in Burton-upon-Trent in 22. Scarlatina prevailed with great virulence in Wolverhampton, causing 69 deaths in the Bilston sub-district.

In West Bromwich small-pox, scarlatina, and typhus were very fatal. In Worcester a large number of persons have been vaccinated and re-vaccinated, which has materially checked the spread of small-pox. Birmingham and Aston have been severely visited by small-pox and scarlatina. The Registrar of the St. Martin's sub-district of Birmingham says :—

The deaths are above the average. Small-pox has been very prevalent, and proved fatal in 22 cases. Vaccination is frequently disregarded. There is no local medical officer of health in the town.

It is to be hoped that this important town, following the example of Liverpool and other places, will not long remain without the services of an efficient Officer of Health.

In the NORTH MIDLAND COUNTIES several districts were visited by small-pox, scarlatina, and typhus, particularly Lincoln, where good water is represented as having been exceedingly scarce for a very long time.

Most of the districts of the NORTH WESTERN COUNTIES show a high rate of mortality, chiefly owing to the prevalence of small-pox, scarlatina, typhus, and measles. Liverpool suffered severely. The Registrar of the Mount Pleasant sub-district says :—

The deaths are considerably above the average, chiefly owing to the remarkable prevalence of typhus; no less than 310 deaths are ascribed to that disease, a large number of them occurring in the workhouse. Small-pox proved fatal in 32 cases; 20 deaths occurred from diarrhoea, and 19 from scarlatina.

in the Sixteen Years 1849-1864.

The Officer of Health will no doubt meet with the active support of the local authorities in devising means to improve the sanitary condition of this populous and important town. In Prescot a very remarkable mortality prevailed; the deaths were 786 against 454 in the same season of 1863 and 443 in 1862. The sanitary state of the town is stated to be very bad; vaccination is neglected, and want of cleanliness is observable in the houses of the poorer classes. The Registrar of the St. Helen's sub-district of Prescot says:—

The deaths exceed the average considerably. The mortality has been greatest amongst children in consequence of the prevalence of scarlatina and small-pox. 120 deaths occurred from scarlatina, and 24 from small-pox. Small-pox is most prevalent in that part of the town noted for its defective sanitary arrangements, and inhabited principally by the Irish. In this portion of St. Helen's the evils arising from want of sewers, unpaved streets, small and unhealthy dwellings, are still further increased by the crowding of several families in one house, and an entire absence, apparently, of all ideas of cleanliness.

In the Oswaldtwistle sub-district of Blackburn 300 persons were attacked by typhus, of which 16 died: the medical men attribute the prevalence of the disease to bad drainage.

Many districts in YORKSHIRE experienced a high rate of mortality owing to the prevalence of small-pox, scarlatina, typhus, and measles; and the same diseases were more or less fatal in the districts of the NORTHERN COUNTIES and also in MONMOUTHSHIRE AND WALES.

Health of London in 1864.

IN LONDON 102,625 children, of whom 52,383 were boys, and 50,242 were girls, were born last year; and 78,238 persons, namely, 39,551 males, and 38,687 females, died in the same time. The population which, by continual process, bears these twin fruits of life and death, is estimated to have been composed at the middle of the year of 2,948,963 lives; it approached the completion of its third million, and dwelt in every degree of density and in endless variety of condition on an area of 122 square miles. Of this surface 71 square miles, being more than half, are occupied by that portion of the metropolis which lies in Surrey and Kent, and is known in these reports by the term "South Districts;" two out of the three millions of people, and part of the third, live on a smaller area, but on the northern and more historic side of the river.

The births of boys were to those of girls in the proportion of little less than 105 to 100; a proportion common in London and England, though

it varies in the several counties of England. But this male majority in the births does not avail to secure a male majority in the population; for in England the aggregate number of women and girls is 105 to 100 men and boys, and in London the proportion is as 114 to 100. The mortality of males is greater than that of females, and the great metropolitan labour mart appears to draw and keep within its vortex more unmarried women from the country than unmarried men.

When short periods of time are taken, the operation of a law is subject to accidental irregularities; but the uniformity of the rule, which in births gives a majority to males, is apparent from the fact that of the fifty-two weeks of last year, in only nine was the number of girls registered greater than that of boys.

A similar excess of males over females prevails in the deaths; but it is less in degree, and when weekly numbers are taken, exceptions to the rule, as might be anticipated, are more numerous. In twenty out of the fifty-two weeks the entries in the death-registers of females exceeded those of males. It is chiefly in severe weeks of winter cold that this exceptional preponderance will obtain, because bronchitis finds its victims most readily amongst old persons, and in the present constitution of the London population it is in the advanced stages of life that the female element, as compared with the male, exhibits a great abnormal development. At sixty years of age and upwards there were, at the Census of 1861, 146 women to 100 men.

The births fluctuate from week to week within narrower limits than the deaths. The greatest number of births was returned in the eleventh week, and was 2177; the lowest number in the twenty-fourth week, and was 1776. But in January cold or other unfavourable atmospheric causes raised the deaths to what may be termed not unjustly "a plague rate of mortality;" for in the second week of the year they were 2427, and in the third week 2180, and in thirteen other weeks, chiefly at the beginning or towards the end of the year, they were above 1600. On two nights in the first week of January the thermometer fell as low as 14° and 15°. The lowest number of deaths was returned in the twenty-second week, when it was 1213. It will furnish a further indication of the high mortality, to state that in only eleven weeks during the year was the number below 1300.

The rate of mortality was 2·653 per cent. of the population (for males 2·876; for females 2·459). The average in twenty-five years, which include two periods of epidemic cholera, was 2·432. The death-rate was not so high as it was last year, in any of the preceding twenty-four years, except 1847, the influenza year, when it was 2·695 per cent., and 1849 and 1854, the two cholera years, when it rose to about 3 per cent.

In the two groups of districts which contain the densest populations, namely, the Central and East districts, in the former, a population of about 400,000 living on three square miles, and in the latter another of about 600,000 persons living on ten square miles, the mortality rose to 2.9 per cent. In the West, North, and South districts the death-rate was not much below or above 2.5 per cent., but the first of these three groups was the healthiest, perhaps because the people who live in it may enjoy on the whole the amplest provision of food, fuel, clothing, and house shelter against inclement seasons.

The mean temperature of the air was below the average of 23 years in seven months out of the twelve; in two it did not exceed the average, and in two out of the remaining three months was but slightly above it. In April and May the streets of London, under favour of the weather, were unusually clean; in the neighbourhood of squares the air was fragrant with lilac and hawthorn blossom; and it became possible for pedestrians to pursue their daily walks with enjoyment.

The following table exhibits the numbers of deaths in the last five years in some of the larger districts, in which the increase that occurred last year appears to have been the most important:—

	1860.	1861.	1862.	1863.	1864.
Kensington - -	3814	3925	4097	4371	4946
Westminster - -	1700	1751	1704	1936	2144
Pancras - - -	4268	4703	4536	4747	5457
Islington - - -	3028	3123	3496	4340	4594
Hackney - - -	1555	1748	1753	1937	2148
Shoreditch - -	2987	3179	3327	3330	3648
Bethnal Green -	2218	2219	2555	2597	3080
Whitechapel - -	2340	2342	2574	2713	2813
Poplar - - - -	1900	1847	2053	2430	2806
Lambeth - - -	3303	3461	3773	3756	4265
Greenwich - - -	2819	3051	3129	3297	4051
Lewisham - - -	1122	1080	1126	1107	1419

It will be seen that in nearly all of the above districts a less favourable condition of health began to be developed in one or two years antecedent to 1864.

Bronchitis, typhus, scarlatina, diarrhœa, and measles were the prevailing forms of disease in the year. Bronchitis caused 8788 deaths, against 6001 in the previous year; typhus 3703, the numbers in 1862-63 having been 3598 and 2808. This latter disease has acquired a great increase of activity in the last three years; and it was more fatal in the latter half of 1864 than it was in the earlier part of the year. The deaths from scarlatina were 3244, and were much less numerous than those of the previous year. Diarrhœa, which exhibited a considerable increase, was fatal in 2894 cases. August was cold, and in this respect was unfavourable to its development; but in the great drought, impurity in the soil and air would accumulate. There was a great increase in measles, and the deaths from it were 2788.

Sixty-five deaths from typhus occurred in the Belgrave sub-district, 103 in Westminster, 60 in the South sub-district of St. Giles, 55 in Hoxton New Town, 85 in Mile-end New Town, 92 in Mile-end Old Town, 177 in Bow and Poplar, 77 in the Borough-road sub-district, 82 in Deptford, 77 in Greenwich, 113 in Woolwich, 73 in Plumstead.

There were 97 deaths from measles in the Kensington Town sub-district, 128 in Islington, 101 in the Holborn district, 111 in St. Luke, 160 in the Shoreditch district, 185 in Bethnal Green, 136 in St. George-in-the-East, 110 in Stepney, 116 in Mile-end Old Town, and 142 in Bow and Poplar. There were 106 deaths from scarlatina in the St. John sub-

district of Westminster ; and the disease was very fatal in Pancras, Islington, Shoreditch, Deptford, Woolwich, and other places.

The deaths in Public Institutions rose from 11,112 in 1863 to 12,731 last year. Included in those numbers are the deaths in Workhouses, which increased from 6187 to 7055 ; and those in Hospitals, which rose from 4247 to 4827. Many old persons in the Workhouses would fall under bronchitis, though their condition, both sumptuary and sanitary, was undoubtedly superior to the condition of a large proportion of that class of the people outside from which they had been drawn. This disease of winter finds its subjects chiefly in poor uncomfortable dwellings, whose inmates can offer but a feeble resistance to frost, cold winds, and other "powers of the air."

Phtthis and bronchial complaints are more fatal both to men and women in Liverpool and Manchester than in London. But if the Metropolis is compared with ten other large divisions of England it is found that phtthis is more fatal to males in London than in any other division, not excepting the north-western counties, which include the towns just mentioned. But the mortality of females from that disease is singularly low, partly perhaps because domestic servants, shopwomen, and milliners who have come from the country retire, when health fails them, to their native air. On the other hand the death-rate from bronchitis and pneumonia for both males and females is high ; it is higher in London than in any of the ten groups of counties.

If coal were cheap, the greater command which the poor would have over that commodity would materially help to reduce the winter rate of mortality. And if smoke were abated at domestic fires as well as at bakers ovens and public furnaces, by more thorough combustion of fuel, the carbonaceous particles which they emit would not darken the air and pollute whatever they touch, nor, by forcing a passage into the throat and lungs, aggravate or excite fatal pulmonary complaints in human beings.* Given a broad river with a temperature at the time above that of the air ; let there be another vast moisture-exhaling surface on its banks, sixty or more square miles in extent, and this area covered with houses which pour smoke from a million chimneys into a still atmosphere ; and the result is that almost impervious fuliginous firmament called "a London fog."

† This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 53 or 52 weeks of each year.

* See Dr. Watson's "Principles and Practice of Physic : " *Spurious melanosis*. Vol. II., pp. 229-32.

But London has acquired almost as much fame for that highly agglutinative compound its mud as for its fogs ; and perhaps there is more connexion than is generally supposed between them. It would be a humble but invaluable sanitary work if the streets were subjected to a perfect system of purification ; if they were frequently and thoroughly cleansed and dried. The attention of Boards of Works may be well directed to this end. The present expedient, by which householders who pay rates for parochial management are expected to clean the pavement in front of their own houses, is unjust in principle and futile in practice. The whole width of thoroughfare from frontage to frontage should get the benefit of the same brooms and shovels. Old persons, whose avocations compel them to be much out of doors, in feebly urging their steps over filthy streets waste much of that strength which should be husbanded for the employments by which they live. And how can poor people be expected to keep the inside of their houses free from damp and dirt when all the adjacent exterior is a "mud-ocean?" A good scavenger is a practical teacher of that cleanliness which is said to be next to godliness ; and if the streets were well kept, the crowds who frequent them would read excellent plain sermons in the stones.

The increase of typhus is a matter of much regret. The Medical Officers of Health have to contend not only with the evils which attend rapidly increasing populations, but also with the overcrowding of particular localities by the clearing of neighbourhoods for improvements and extensive railway works.

TABLE 9.—LONDON.—Deaths and Meteorology, 1849-64.

YEARS.	Total Number of Deaths.	Mean Temperature of Air.	Dryness of Atmosphere.	Fall of Rain in Inches.	Mean Weekly Amount of Horizontal Movement of the Air, approximated to the results of Robinson's Anemometer by reductions from Whewell's in 1859.	WEEKLY AVERAGE OF 1864.						
						Number of Deaths weekly.	Mean Temperature of Air.	Average daily Range of Temperature.	Dryness of Atmosphere.	Fall of Rain in Inches.	Amount of Horizontal Movement of the Air in each Week.†

						Fourth Quarter	1506	45·7	19°0	5°0	0·84	1666

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer.

POPULATION OF THE UNITED KINGDOM,
with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317
1831 -	24,423,588	12,004,025	12,419,563
1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
Estimated. 1866 -	30,329,207	14,775,810	15,553,397

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, a certain proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers (1801-61) have been deduced by raising the enumerated population of the United Kingdom, including the islands in the British Seas, (see Table 9. p.84. of Vol. III. Census of England and Wales, 1861,) up to the middle of the respective Census years. In 1866 the numbers have been estimated by adding the population enumerated in the islands in the British Seas in 1861, and the number of men in the Army, Navy, and Merchant Service abroad, (see Table 3. p. 81. Vol. III. Census 1861,) to the population for 1866 returned in the Table on p. lxx.]

Logarithms of the above Population of the UNITED KINGDOM.

* In the other 62,947 cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age" or "Minor." "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

of the births—especially of illegitimate children in London and large towns—escape registration.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 641 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and w for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a table of the Deaths in the principal Public Institutions situated in the Districts of London see pages 83-4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits included a Workhouse belonging to the District or Union; H indicates Hospital or Infirmary; and L Lunatic Asylum.
 † For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.
 ‡ Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a few persons, or diseases which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

(continued at page 128.)

CAUSES OF DEATH at different Periods of Life, in the Year 1864.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (neerencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120-125.]

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND in 1864, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L.	175-193
TABLES	194-208

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by WILLIAM FARR, Esq., M.D., F.R.S.

YEAR 1864.

SIR,

It has been shown in your Report that more people of all ages died in this year than in previous years. The rate of mortality was higher in infancy, higher in middle life, and much higher in old age, than the average.

The causes of death, as far as they have been recorded, are given in the Tables.

The excess in the rate of mortality is due in a great degree to the prevalence of scarlatina a disease of childhood; and to the fatality of bronchitis a disease of all ages. Scarlatina, by the activity of its zymotic elements, became epidemic among the increased numbers of susceptible children in unfavourable conditions; and the cold weather in the first and last months of the year induced bronchitis.

Of the total deaths 4478 were from causes not specified or ill defined; and 3321 were sudden and, generally, the subjects of inquests unsuccessful in ascertaining the causes. It must not be assumed that the causes of the remaining 487,732 deaths were all accurately determined.

It was shown for the year 1858 that in every 100 deaths 83 were certified by the medical attendant or the coroner, and that 17 were uncertified. In 6 of the 17 cases uncertified there was no medical attendant; that is, no qualified medical attendant; for the certificates of quacks, druggists, herbalists, and such like practitioners were rejected by Registrars in conformity with your instructions. In 11 of the 17 cases the cause of death was *not certified* for unassigned reasons. It was in Wales and in Yorkshire that the people were left to the greatest extent without medical advice. In London 97 per cent. of the deaths were certified, and only *one* per cent. of the deaths was returned as happening to a person left without medical advice. In a certain number of the uncertified cases, such as deaths by small-pox, the causes were, no doubt, correctly reported by the informant on the verbal statements of medical men, from whom certificates were not procured in time for registration.

There has been no essential change since in the character of the returns of the causes of death. They are subject to two kinds of imperfection, which it is necessary to distinguish.

The first is the consequence of the imperfection of medical science itself, and will only diminish as that science advances. And the second arises from the imperfect practical application of existing science: only a portion of the population has the advantage of consulting the most skilful physicians or surgeons of the day, who are conversant with the newest discoveries in physic; and in the remoter parts of Wales, as well as in some English counties, the medical man lives so remote as to be absolutely beyond the reach of large numbers of the people; many young children, many long afflicted men and women, many old people, die without being seen for weeks before death by a surgeon. Many men die of hernia, many women in childbed, who might be saved by surgical skill. Yet the medical attendance of the population is, I believe, better in England than it is in any other state of Europe; and the Poor Law does much to extend its advantages to the lowest classes. Where surgeons are not found in attendance on the sick they should be supplied in some way; and if this were done, science might well be employed to inquire into the causes of deaths which it had endeavoured to prevent.

To resume: thousands of deaths occur without any scientific inquiry into the cause of death; and in thousands of other cases medical science seeks in vain to unravel the mystery which enshrouds the extinction of life.

The coroner often simply returns "natural death." As one of the great ends of Government is the protection of life, the inquiry, however, in such cases is not without its use, as the negative finding of a jury is a satisfaction to the public mind, and suffices sometimes to relieve the innocent from suspicion. At the same time it often deters the tempted man from crimes which he feels are likely to be discovered.

In the earliest dawn of the nation the English inquired into the causes of death with a view to discovery and prevention. The protection of life was a fundamental principle of their laws. It was as much an object of their political organization as national defence or war. And the dead body, it was held, called for the coroner's inquest whenever death was sudden or violent or in prison; that is, whenever it was the result, or appeared to be the result, of any discoverable cause. The plagues of the sixteenth century proved that human life is exposed to invisible enemies, more deadly than the mechanical forces of nature, the ferocity of animals, or the malignity of manslayers; and towards the end of Queen Elizabeth's reign the London bills of mortality were commenced (1592). It was part of the general measures of her able government, by which abstracts of burials, baptisms, and marriages were directed to be compiled in each parish; and persons were appointed to view the bodies of all that died before they were suffered to be buried, and to certify of what probable disease each individual died, in statements of which it was the duty of the minister to make a weekly return. The deaths by plague and by all other diseases in the aggregate were published in the London bills so early as 1603; and in 1629 the several casualties were set forth weekly. Graunt gives a complete return for the year 1632 of the causes of 9535 deaths in London, whereof 8 were of the plague.* He says, that though not published, "the original entries in the *Hall-books* were as exact in the "very first year as to all particulars as now; and the specifying of "casualties and diseases was probably more."

Graunt thus describes the mechanism by which the observations in this remarkable series of Tables were collected:

"When any one dies, then, either by tolling or ringing of a bell, or by bespeaking of a grave of the *sexton*, the same is known to the *searchers*, corresponding with the said *sexton*."

"The *searchers* hereupon (who are ancient matrons sworn to their office) repair to the place where the dead corps lies, and by view of the same, and by other enquiries, they examine by what *disease* or *casualty* the corps died. Hereupon they make their report to the *parish clerk*, and he, every *Tuesday* night, carries in an account of all the *burials* and christenings happening that week to the Clerk of the Hall. On Wednesday the general account is made up and printed, and on Thursday published and dispersed to the several families who will pay four shillings *per annum* for it."

Graunt discusses the value of the bills, and shows what "corrections upon the, perhaps, ignorant and careless *searchers'* reports," were required; at the same time he says, as "many of the casualties were but matter of sense," the *searchers'* reports might be sufficient in such cases. In many of the more intricate cases "the *searchers* are able to report the "opinion of the *physician* who was with the patient, as they receive the "same from the friends of the defunct;" and in very many cases, such as drowning, small-pox, dropsy, falling sickness, palsy, ague, rickets, their own senses were, in his opinion, sufficient.

Many of Graunt's judicious observations on the casualties of the bills are applicable to the reported casualties of the remotest parts of the country in the present day; for some districts still represent the ignorance

* Natural and political observations upon the London Bills of Mortality. By Capt. John Graunt, Fellow of the Royal Society. Tuesday, June 20, 1665. At a meeting of the Council of the Royal Society ordered to be printed. 5th ed. 1676.

of the cities of ages gone by. And Graunt was essentially right, for there can be no doubt of the value of even the imperfect reports of facts in the early bills directly concerning the life and death of Englishmen. They had on them in Graunt's book the approving stamp of the Royal Society. Sydenham, it is evident, had the London bills before him in writing his imperishable commentaries. Arbuthnot used them in an argument on Divine Providence and in the interests of morality.* Heberden in a masterly paper illustrated the use of the weekly observations, and deduced from them an important law.† Simpson and Price constructed life tables from the London bills.

The parish clerks of London deserve our gratitude for their perseverance in publishing the bills, which the citizens took in weekly for "no other reason" that Graunt could discover than curiosity about increase and decrease of burials or rare casualties, "so as they might take the same as a text to talk upon in the next company;" and in the plague-time, "that so the rich might judge of the necessity of their removal, and that tradesmen might conjecture what doings they were like to have in their respective dealings." Similar bills were commenced in some other English and continental cities, but they were allowed to drop, leaving the series incomplete.

While medical science advanced, the weekly bills remained stationary; their interest was not kept up by eruptions of plague; Dissenters' burials were not included; and the clerks of many parishes made no returns, or only made them irregularly. And even when complete, the bills gave no information about the population of the towns and counties of the whole kingdom.

It was only in 1837, five years after the first epidemic of cholera, that under the Registration Act provision was made for the inquiry into the cause of nearly every person's death. The column of the schedule headed "Cause of Death" was introduced in the House of Lords. There has then since July 1st, 1837, been two kinds of inquests into the cause of death,—the Coroner's Inquest and your Inquiry.

The latter measure appears to have been looked upon as experimental. There was no view of the body, no arrangement for obtaining evidence, no machinery for instituting inquiry; and where there had been no medical attendant, or where the medical attendant refused to supply the information in his possession, no means of getting the required facts, except by making the medical man the legal informant. The imperfect information of the coroners was expressed in rude, vague, antiquated language, and was less satisfactory than that supplied from other sources. The heads of the medical profession supported the Registrar General's efforts to overcome the first difficulties; you circulated medical certificate books with a *Nosology* freely among the profession all over the country. You addressed coroners, and since the office has been strengthened by the Act authorizing the payment of medical witnesses, their information is much more valuable than it ever was before. The result is apparent in the returns of the present year. You succeeded in providing in medical men frequent substitutes for uninstructed jurymen and "ancient matrons sworn." Under the present administrative arrangements little further progress can be made.

It is notorious that the registration of the cause of death in its present form has contributed to bring crime to light, and has facilitated the conviction of the guilty. The trials of Palmer, Pritchard, and other

* An argument for Divine Providence taken from the constant regularity in the births of both sexes. By Dr. John Arbuthnot, Trans. of Royal Society. Vol. xxvii. p. 186. He shows by the London bills that males always exceed females in the yearly births, but that external accidents make a great havoc among males. He concludes that "Polygamy is contrary to the law of nature and justice."

† See Influence of Cold upon Health. By W. Heberden, junior, M.D., Phil. Trans. 1796, p. 279.

signed in it his name, description, and place of abode,* thereby rendering himself subject to the pains and penalties of perjury if he has wilfully made any false statement touching any of the particulars to be registered.† And Fletcher not only got a false certificate, but procured probate of a forged will.

It must, however, be admitted that in a large city the Registrar sitting in his office has no means, or very imperfect means, of knowing and identifying informants, or of verifying the accuracy of the various particulars which he enters on the national registers. The Bank of England refuses to accept the death certificate as a proof of death.

The Registrars, appointed generally by Boards of Guardians, before their appointment is confirmed by you, answer questions in writing, and their competency is proved by their copies sent to the office, and by the state of their registers which are periodically examined by Inspectors. The Registrars are a highly respectable body of men of all the various classes of society, and as they are only paid small fees they are necessarily engaged in other professions, in trades, or in some branch or other of industry. The work requires integrity, accuracy, sound sense, good writing, and close attention to all the minute provisions of the Act and of the regulations. The clerical part of their duty is checked by the Inspectors, by the Superintendents, and by the central Record department; but there is at present no means of checking the registered facts, or of determining the degree of accuracy with which informants report and Registrars record the particulars of each entry. Where the informant is educated and interested, he naturally reads before signing the entry, and thus to some extent checks the work. Unfortunately it happens that in a large proportion of cases the Informants sign by a mark, and as they cannot write their names they cannot read the record which they sign alone in the presence of the Registrar. They cannot check the record. This has given occasion to cases of fraud which could scarcely have been anticipated. In the course of twenty-nine years, out of a body of 2200 officers, four, for the sake of the shilling an entry, inserted long series of fictitious entries of deaths which never occurred. They invented all the particulars of hundreds of deaths. The first case was that of a Registrar of All Souls, Marylebone, who died before the discovery; he served under a most acute Superintendent Registrar. The second case was that of a Registrar of Howard-street Sub-district, Liverpool, of respectable connexions, who for fictitious entries was dismissed, convicted of felony, and sentenced to six months imprisonment with hard labour. These two cases, and another at South Shields, are referred to in your Reports,‡ and the required corrections are made in the calculations of the mortality of Marylebone, of South Shields, and of Liverpool. This offence, it may be mentioned, was first distinctly defined in the Forgery Act of 1861 (24th & 25th Victoria), under which the wilful insertion of any "false entry of any matter relating to any death" renders the offender liable, on conviction, to penal servitude for life (s. 36.); yet a Registrar of Howden, who began registering fictitious entries about ten years ago, continued the practice up to a recent date under the eye of his Superintendent, and subject to the periodical visitation of intelligent Inspectors. The causes of death were copied, with slight variations, from medical certificates, and his imaginary informants were represented as signing with marks. This man of ordinary capacity dared and was able to do, because while there is a check on the handwriting and the form of entry, there is no check whatever on the accuracy of record, or on the veracity of informants. The facility of signing with marks of single informants tempted four men into the commission of these extraordinary crimes for the sake of small sums of money. For money the same

criminals might, it is to be feared, with the hope of impunity before them, have falsified the record of important facts affecting vast amounts of property in insurances and successions. Fictitious entries embarrass statistical inquirers, and they were first brought to light in this office by the exorbitancy of the results. The Howden fraud was kept within narrower limits; it was discovered through the clergyman of a parish where the mortality was exaggerated.

It is deplorable that a single case of fictitious entry by a Registrar, or of deliberate fraud by informants, should have occurred during twenty-seven years; but it must be borne in mind that few Registrars among many thousands, and few informants among many millions exposed to temptation, have criminally falsified the public records. The wilful falsifications are insignificant in number in comparison with the errors in 11,011,291 entries on the death registers.

I have referred to such defects of registration as vitiate the evidence that the registers afford affecting property, and the use of the records for scientific induction. I have now to refer to the imperfect security afforded by incomplete as compared with complete registration against murder and attempts on life. The following death was thus registered:—

“Died 11th June 1848 at Wix (Manningtree) William Constable, aged 38 years, labourer, decline (3 months). *Not certified.*”

“× The mark of Mary Faint, present at the death, Wix.”

This was one of the Essex poisonings. The man, it was afterwards discovered, was poisoned with arsenic by his half-sister Mary May, aged 28. She was tried at Chelmsford, found guilty, and executed.

The facility of registration in this easy way does not discourage the criminals. They go on with greater confidence. And this was only the first discovered case of a series of similar murders of husbands and children by wives and others, who could make their marks and administer arsenic in the Essex villages of Wix, Bradfield, Ramsay, Dovercourt, Tendring, Thorpe, Kirby, Mistley, Great Oakley, and Great Holland.* Sir James Graham, in the House of Commons, in June 1846, referring to another series—the Norfolk poisonings,—said: “There was reason to believe that in the county of Norfolk no fewer than twenty persons had died from poison administered by one individual, and in none of these cases had an inquest been held.” I may cite other instances.† One murder successfully registered without detection led to the commission of more murders, and murder became epidemic by imitation. It is probable that the number of such cases was exaggerated, but the terror they inspire is in itself an evil, and by crimes of the kind the country is dishonoured in the eyes of the world.

These deaths occurred in country villages among ignorant people, but in towns the detection of crime is rendered in certain cases much more difficult than it is in the country. The body can be buried in any churchyard or cemetery without a Registrar's certificate; and the clergyman or burying officer, though bound to give the Registrar notice (which he sometimes forgets), can only give such particulars as the parties conducting the funeral supply. The notice, if written, may be addressed to the wrong Registrar, or be so vague or perhaps erroneous that the Registrar of a large district, like Islington in London, cannot find the house in which the death occurred. Bodies are sometimes removed

* These cases are well described in the letter of a barrister in the *Morning Chronicle*, April 11th, 1849.

† In one case it happened that Mr. Hitchins, who was coroner for Kesteven and Parts of Lindsey, was also a Registrar of Deaths in Lincoln. He assigned the following reasons for wishing to retain the latter office:—“My object in desiring to retain office is not for the emolument, but because I have found it to assist me essentially in my office of coroner. By its means of information three murderers, and one for manslaughter, have been transported; and at the present time two murderers, and one for manslaughter, are for trial at the next assizes, from being unable to obtain certificates.”—*Letter dated Lincoln, 3d February 1849.* The murderers in another district might have escaped, as the deaths might have been registered without a certificate.

unregistered to other districts for burial, and all traces of them are lost. As still-born children are not registered at all, and are buried with little difficulty, there is a great temptation to inter the bodies of children living only a short time as still-born. This opens another gate to crime.

By forbidding, as in France, the burial of any body without the Registrar's certificate, the latter class of evils will be obviated; and although inconvenience must occasionally arise from the absolute prohibition of the burial of the uncertified dead, that inconvenience should be encountered for the sake of many compensating advantages.

There is another defect in the Act: some old women and men, like hermits of old, live in solitary dwellings; in their last illness terminating suddenly they may have no person in attendance, and no witness present at their death. In these cases there is no legally qualified informant, and the deaths are not registered; the causes of death remain for ever unknown. The coroners are now paid by fixed salaries, and in many cases of violent deaths they do not hold inquests, unless they are led to suspect crime. This saves the county expense, but it has resulted in the absolute non-registration of deaths.*

Such are some of the defects by which the registration of the causes of death, and of the fact of death itself, is rendered less useful than it might be made for the purposes of science, for sanitary administration, for evidence affecting successions of property, and for the protection of life. To remedy these defects, amendments of the Act are required; families must take more trouble to find qualified informants, and the country must consent to pay the necessary expenses of fuller inquiry.

It is now sufficient to send to the register office one informant, such as a nurse, and although a medical certificate is asked for, it is not indispensable by law, and is often not produced. That is all the trouble families are put to in registering their dead; and the Registrar gets a *shilling* from the poor rate for recording, and making copies of the entry to be transmitted to the central office. The Superintendent Registrar gets *2d.* for examining the copy of the entry with the original entry. Each death costs the country *twenty pence* for registration, including pay of officers, cost of books, ink, copying, custody of records (which it is expected will last for centuries), indexing, analysing statistically, and administration.

The inquiry into the cause of death might be made sufficient for all its great and useful purposes by a simple extension of the system of medical certificates which you introduced, and which has for many years been in partial use. And as I am not disposed, in imitation of foreign practice, to relinquish the principle of confidence in the medical attendants on families, I submit that having been in attendance up to the date of death, their certificates should still be received, provided they *have seen the deceased on the day of death, or have seen the body subsequently for identification.* It would be undesirable to enforce the grant of the certificate by any penalty; and under this arrangement the medical attendant should charge the family a fee in proportion to his ordinary

* I subjoin an illustrative case:—

(Copy.)

Superintendent Registrar's District, Chepstow,
Registrar's District, Lydney,
May 17th, 1866.

Sir,

On Tuesday last, the 15th day of May, a lad named George Morgan, aged 16 years, accidentally fell into Lydney Basin and was drowned; he was never seen alive after falling into the water. The serjeant of police informed the coroner for the district of the accident, and the coroner informed the police there would not be any occasion for an inquest in such a case, as there was not any doubt as to how the lad came by his death. I should be glad to be informed of the proper way for me to make the entry in the Register Book of Deaths, and also as to the party to be the informant.

I remain, Sir,

Your obedient servant,

WILLIAM PACKER, Registrar,
Lydney District.

To

The Registrar General.

charges. For pauper patients the Poor Law medical officer should be entitled for the certificate of death to a fee fixed by the Commissioners.

Under these circumstances many deaths which are now "certified" would be "uncertified" by medical attendants, as the friends of out-patients of hospitals and dispensaries, as well as others, often get certificates to which they are not entitled through the kindness of the medical officers, who have sometimes no means of identification or verification. In all such cases, and in every case of death without medical attendance up to the date of death in which the certificate could not be obtained from a legally qualified medical attendant,—an informant, or the occupier of the house, or in his default an inmate, should be bound to give notice to a medical officer specially appointed for the duty in each of the districts of the kingdom. This *registration medical officer* would thereupon visit the body, and if all was clear, and admitted of satisfactory determination, send his medical certificate of the probable cause of death by the informant or by post to the Registrar, who would upon its receipt register the death, and issue his certificate for burial in the usual course. The *registration medical officer* would, if the case was enveloped in any suspicion or obscurity, refuse his certificate until an inquest had been held or refused by the Coroner, whose inquiry should by no means be superseded. The *registration medical officer* should be specially qualified to conduct *post mortem* examination, and, on being summoned, might appear as the medical witness at the Inquest. By practice he would acquire aptitude in the investigation of the obscurer causes of death, and in the detection of crime. Under this system every death, and the cause of every death, would be certified; and poisonings and criminal attempts on the life of children or adults would be less frequent, as they would with difficulty escape detection. Expected impunity would not invite men or women into the commission of fearful crimes. And human life would be under a new safeguard.

It is necessary to alter slightly on the above plan the present form of medical certificate, and three specimens of the requisite altered forms are subjoined. If the still-born deaths are to be certified, a special form would be required.

To the REGISTRAR of the SUB-DISTRICT in which the DEATH took place.

I hereby certify that I attended John Jones, carpenter, aged 21 years last birthday; that I saw him alive on January 11th, 1866; that he died on that day at 7, King-street, Marylebone; and that the cause of his death was—

	<i>Cause of Death.</i> <i>(In case of Autopsy write P.M.)</i>	<i>Time from Attack till Death.</i>	<i>Certified by—</i> Edward Lawrence.
(a) First.	Typhus	19 days.*	Prof ^t Title, M.D. Address, 37, Soho-square.
(b) Second.	Pneumonia, P.M.	3 days.*	Date, January 13th, 1866.

* Each form of Disease, or Symptom, is reckoned from its commencement *till* Death.

N.B.—This Certificate is intended solely for the use of THE REGISTRAR, to whom it should be delivered by the person giving information to him of the particulars required by law to be registered concerning the Death.

Note.—(1) The Certificate of Death should be procured from the MEDICAL ATTENDANT who has either seen the deceased on the day of death or has afterwards seen the body. In the absence of such Certificate the body must be inspected and the Certificate be given by the REGISTRATION MEDICAL OFFICER of the District or by the CORONER.

(2) The Registrar will in all cases register the name of the Medical man who signs the Certificate.

(3) No death can be registered and no burial take place until the death is certified.

The persons who are qualified to act as Informants, and to sign the Register as such, are—

- (1) Some relative or other person *present at the death.*
- (2) Some person *in attendance* during the last illness of the deceased;
Or, in case of the death, illness, inability, or default of all such persons,
- (3) *The occupier of the house or premises;*
Or, if the occupier be the person who shall have died,
- (4) *Some inmates of the house in which the death shall have happened.*

To the REGISTRAR of the SUB-DISTRICT in which the DEATH took place.

I hereby certify that I attended Jonathan Williams, aged 32 years last birthday; that I saw his body on January 26th, 1866; that he died on January 24th at 211, Oxford-street; and that the cause of his death was—

	Cause of Death. (In case of Autopsy write P.M.)	Time from Attack till Death.
(a) First.	Small-pox (confluent) (first attack)	21 days.
(b) Second.	Not vaccinated

Prof^l Title, M.R.C.S., REGISTRATION
MEDICAL OFFICER.
Address, West-square, Lambeth.
Date, March 22nd, 1866.

The Registrar invariably to write "certified by" in his Register Book, adding the name and title, and if out of the district the address of the medical attendant or of the registration medical officer, as the case may be. The Registrar to file the certificates, and to produce them for examination with the certified copies by the Superintendent Registrar, who would certify the accuracy of the copied entry of the cause of death.

It would increase the value of the evidence if the certifying physician himself signed the entry in the register. But this would be a complication; it would increase the expense, give much trouble, and produce delay, so that I do not propose it. It was tried in the case of the coroners, and failed.

The advantages of the proposed amendments may be briefly enumerated:

(1.) The *cause of death* would in all cases be certified by one professional witness, and would be recorded as correctly as is practicable in the present state of science.

(2.) The fact that a given person died at a given place would be attested by the informant as at present, and the evidence would be enormously strengthened by an educated witness. While so large a portion of our informants cannot even write their names, this is of great importance.

(3.) Secret murders and attempts on life, and deaths of children, or of old people, from neglect, could rarely escape detection; they would, other things being equal, be less frequent than they have been in past times. Life would become more secure. The public solicitude, like a Providence watching over all, would cherish the reverence of all classes for human life.

(4.) The frauds of informants would be less common, and no Registrar would again manufacture fictitious entries, thereby throwing discredit on the whole of the *national registers*.

(5.) Much trouble would be saved to the public, who are now put to expense in getting corroborative certificates, as it is felt that the present

certified copy of an entry is most imperfect evidence of the death and identity of deceased persons.*

(6.) The registration medical officer visiting the dwellings of people in unfavourable sanitary conditions would discover and point out the consequences of those conditions to the families themselves, and to the authorities in seasons of cholera, of fever, or other epidemics. The authorities would find it convenient to make him the health officer of the district; and often where such an officer already exists, he might discharge the medical registration duties. The Post Office would employ the registration medical officer in insurance business, and so would insurance offices, to whom he could render essential service in putting a stop to the numerous frauds which are every day committed at their expense.

You have appointed two *Inspectors* with great advantage, as they instruct Registrars, and inspect the books on the spot in periodical visits. But they proceed no further than the books; and, unless the books themselves supply evidence of inaccuracy, no inaccuracy is discovered. They do not institute any comparison between the actual or the ascertainable facts and the records of those facts. Here many errors must occur. At this office no important work is allowed to pass unchecked; and after selecting the clearest headed men, the calculations are all made in duplicate, and carefully compared. Experience has shown that this is necessary to ensure accuracy. It provides against errors of human fallibility, and errors of negligence. Now the registration records need not be made in duplicate by two separate officers and compared; but by periodical inquiries into the actual facts of *cases where the informants sign with marks* every Registrar would work under a sense of responsibility, and would do his work better than he does it now. I beg to suggest that you should be allowed to appoint an Inspector to be especially employed on this duty, with a Medical Inspector to be especially employed in looking after the registration of the causes of death in such districts as you might be pleased to direct.

Medical men have to learn the difficult duty of returning fatal diseases on a uniform system and under the same names. Their attention might be called in a friendly way to any imperfections in their returns. This is found to work well in Geneva, where it was performed for many years by my friend Dr. Marc d'Espine with the best possible result, both in the interests of science and of justice.

This improvement in our system of registration would be quite in accordance with English habits, which must ever be religiously respected in a matter so solemn as death. The public medical officer would

* The following letter supplies an illustration of the expense and trouble to the public to which imperfections of registration give rise:—

Sir,

Astwood Bank, Bromsgrove, May 22d, 1866.

A sum of money is invested in the 3 per cents. in the names of trustees. The survivor wishes to effect a transfer. The directors of the Bank of England refuse to receive any certificate but that of burial. These have been forwarded, but now returned with a printed form of declaration to be made before a magistrate that these certificates have been compared with the register book of the cemeteries, and are found a true and faithful copy. This must be done by some one who personally knew the deceased.

This will occasion us considerable *trouble and expense* as we shall have to send a person a long distance. I always understood a certified copy of the register of death bearing the seal of the office was to be received in law without any further proof.

(Signed) JOHN PHILLIPS, Baptist Minister.

To mention a case of fraud:—In November 1844 Elizabeth Mason, married, residing at Walsall, registered the pretended death of her brother, John Hodson, and by means of the certified copy of the register obtained from the executors of one Drinkwater payment of a legacy which, by his will, he had bequeathed to John Hodson on his attaining 21, and to the said Elizabeth Mason in the event of *Hodson dying under that age*. In February 1848 Hodson appeared and claimed the legacy which had been received by Elizabeth Mason. She was tried and convicted at Stafford Lent Assizes, 1848.

only intervene when the family had no physician in attendance, and wherever he attended it would be confidentially, for the comfort and satisfaction alike of friends and of the community.

This system, I submit, would be more efficacious than the registration now in use in France, where the death can be registered by declaration, without assigning the cause of death. The inspection of the body by the *Officier de l'état civil* would be superseded by the certificate of the medical attendant, or of the registration medical officer; the inquiry into the cause of death would be universal; and the evidence of the certificate of registry would be valid. The French explicitly reject women as informants,* and thus must in many cases forego the best possible testimony. Women are as truthful as men; and their evidence is as trustworthy where they have equal opportunities for the observation of facts within the scope of their knowledge.† Women are almost always, except on the field of battle, in attendance or present at death. The wife does not forsake the husband, the mother the child, in the last moments. In marriage and in birth, the two great acts of registration, the woman is indissolubly associated with the other sex, and from men in death they are not divided. On what ground then is the woman rejected peremptorily as a witness? The French principle is inapplicable to English women. But in England we may well avoid rushing to the other extreme. Why should a majority of the informants of some districts be ignorant women, who sign the registers with marks, and cannot read and check the entry to which their signature is attached in the national records?‡ The medical certificate is indispensable under such circumstances.

The improvements in registration cannot be carried out without expense. The medical certificate will cost the public from *a florin to a guinea* an entry; only the portion of the pay for the registration medical officer and for inspectors will come out of poor rate and out of consolidated fund. It is desirable to make the fee of the registration officer

* Code Civil, livre 1. sec. 37. : Les témoins produits aux actes de l'état civil ne pourront être que du sexe masculin agés de vingt-un au moins et ils seront choisis par les personnes intéressées.

† Criminal returns of England 1864. The number of men committed for *forging* and *uttering forged instruments* was 140, of women 4; for *uttering and having in possession counterfeit coin* 330 men, 98 women, were committed in the same year.

‡ NUMBER and PROPORTIONS per Cent. of Persons who were Informants of Deaths, and of Persons married, who signed the Register with Marks in eleven Districts or Sub-districts of England and Wales in a portion of the Year 1864.

	INFORMANTS AT DEATH (exclusive of Coroners and Informants in Institutions).			PERSONS MARRIED.		
	Total Number of Deaths.	Informants signing with Marks.	Proportion per Cent. signing with Marks.	Total Number.	Number signing with Marks.	Proportion per Cent. signing with Marks.
PERSONS - - -	3,196	1,537	48	10,864	2,902	27
Males - - -	1,208	312	26	5,432	1,142	21
Females - - -	1,988	1,225	62	5,432	1,760	32

The facts are compiled from the Registers of the districts of Chelsea, Reading, Peterborough, Romford, Highworth, Rugby, Derby, Halifax, Durham, and Carnarvon, and the sub-district of St. Martin Liverpool.

Of 100 informants 38 were males and 62 were females.

NOTE.—Exclusive of coroners and informants of institutions, of 1217 informants at death in the county of Northampton 181 were men of whom 52 signed with marks, and 1036 were women of whom 784 signed with marks. Of 1843 persons married 447 men and 499 women signed with marks, or of 100 informants at death 69 signed with marks, and of 100 persons married 26 signed with marks. The ignorance of the informants at death was to the ignorance of the ordinary run of people marrying in Northamptonshire as 69 to 26. Of 100 informants 15 were males and 85 were females.

sufficiently high to command the services of a good class of the profession ; and the tariff must, therefore, necessarily vary in country and town districts with the distances to be travelled, and the variable local medical charges. The fixing of the fee might be left to you, subject to the approval of the Treasury. The cost of registration medical officers and of inspectors would not exceed in the aggregate 50,000*l*.*

If we compare this sum, and the value of the services for which it is to be paid, with the cost of inquests and the cost of funerals, it does not appear to be great or extravagant.

The cost of registering the particulars and the causes of the deaths of the 495,531 persons who died in England and Wales was about 41,350*l*. in the year 1864 ; in 1867 under the improved plan it would be about 91,350*l*.† Instead of 20*d*. it would be about 44*d*. on each death. This sum would be amply recouped in the additional security to life and property. It is computed from the legacy duty returns on 495,531 deaths that about 93,500,000*l*. passes by death to successors. On this sum 92,000*l*. is less than a farthing in the 1*l*. (See Registrar-General's 22d Report, p. 1.)

The coroners of counties and boroughs held inquests on 24,787 bodies at a total cost, including coroners' salaries, travelling expenses, and medical witnesses, of 72,598*l*. This sum is paid out of the rates. It amounts on an average to 2*l*. 18*s*. 7*d*. on each inquest. The jurymen are not paid for their services, but they are summoned, and if they do not attend render themselves liable to a penalty. The value of their time cannot be estimated at less than 25*s*. 5*d*. This will make the cost of an inquest 4 guineas, or 24,787 inquests cost 104,105*l*. in the year. The value of this ancient institution cannot be questioned, but the inconvenience and cost to families left out of account in this estimate is not inconsiderable.

If the inquiry by inquest had been extended to the whole of the deaths, the cost in coroners and in medical witnesses only in the year 1864 would have amounted to 1,451,345*l*., without allowing anything for the time lost by jurymen, and for the inconvenience of families.

The cost of 66,748 funerals in the metropolis was estimated by Mr. Chadwick ‡ for the year 1839 at 626,604*l*. ; and his " proximate estimate of the expense for the total number of funerals in England and Wales," was 4,871,493*l*. He shows that the expense of pauper funerals in London was 13*s*., of artizans 5*l*., tradesmen of second class, &c., 27*l*. 10*s*., tradesmen of 1st class 50*l*., gentry and the higher classes of people 100*l*. ; while the expenditure on the funerals of children under 10 years of age of the corresponding classes, excluding paupers, ranged from 30*s*. to 30*l*. The average cost of funerals of persons of every rank above paupers in London he takes at 14*l*. 19*s*. 9*d*., and including paupers at rather less than 10*l*. I am aware that the cost of funerals of persons of rank runs up to 1,000*l*. or 1,500*l*., and that workmen's clubs pay commonly 10*l*. for burial, but I am disposed to think that Mr. Chadwick's estimate is too high for the whole population, in town and country. Instead of his figures I take the average cost at 6*l*., and then the amount that the nation expends annually on the burial of its dead is 2,973,186*l*. This includes only expenses that figure in undertakers' bills. It neither comprises the extra cost of mourning, nor the expenditure in memory of

* Take the annual deaths at 500,000, and the uncertified cases in the proportions above given as 17 per cent., then 85,000 cases would be visited annually. The cases would be almost exclusively in the poorer classes, and at 10*s*. each the cost would be 42,500*l*.

† I have not brought into account the cost of the apartments in which the records are kept at Somerset House. The conservation of inaccurate documents, it is worthy of note, is as costly as the custody of the most authentic records ; and the State in the former case is in the condition of a bird wasting its care on addle eggs.

‡ Supplementary Report on the Results of a Special Inquiry into the Practice of Interment in Towns, by Edwin Chadwick, Esq., pp. 70-1.

the dead on monuments, or friable stones, which will be obliterated or crumbled into dust long ere the national lists of the dead in the custody of the State have perished.*

It is well to attach solemnity to funerals, but no one can doubt that it would be wiser on the part of the nation to give a florin or a guinea as a fee to a registration medical officer for the benefit of the living and of generations to come than to squander guineas lavishly on stones, or on lids of feathers, rich silk bands, porters, pages, feathermen,† and mutes.

* The expense of an inscription on a common tombstone has been estimated by Mr. Wyatt, the Superintendent Registrar of Islington, as below. It far exceeds the cost of the most efficient and authentic registration of all the essential dates and facts of a man's birth, marriage, and death.

Sacred to the memory of William Matthews of this parish, died 25th December 1865, in the 72nd year of his age. 84 letters at 3d. each = 1l. 1s.

I think it will be about the average to take 3d. per letter for engraving and painting on tombstones, as it is sometimes done as low as 10s. per 100 letters, if the tombstone has been erected by the same mason. The engraving on marble or granite is very expensive.

As one stone may record the deaths of four or five persons, I consider it would be a fair estimate to set down :—

For tombstone	-	-	1l. 1s.	}	for each person.
,, engraving same	-	-	1l. 1s.		
			2l. 2s.		

G. WYATT.

Gravestones endure a very variable time; Sir Thomas Brown (Urn Burial) sets down the time they stand at 40 years. There are paper registers in this office dating from 1567 in excellent condition. I annex two extracts from the register of French Protestants at Southampton.

Extracts translated by Mr. Shoveller from the register of the French church at Southampton, now in the custody of the Registrar General:

James de Cean de Valenciennes was buried on the 26th of November 1567.

Phelippe de St. Legrer from France was buried in the said place, outside the church, the 21st day of January one thousand five hundred and sixty-nine.

Bernard Matien, a lad, native of Bordeaux in France, and abandoned by his father (and through poverty) at the house of William Hersens, died the 10th day of April 1573, and was buried in the evening of the same day.

In the same register is recorded (25th September 1572) a fast on account both of the persecutions by the Duke of Alva in the Netherlands, and the massacre on St. Bartholomew's day (24th August 1572). On the occasion of her visit to Southampton, 4th September 1591, these persecuted Protestants heard from Queen Elizabeth consolatory words, which they record with gratitude.

Mr. Rickman made a special inquiry into the parish registers existing at the date of the Census A.D. 1831.‡ The result of this inquiry is thus stated: "No person will be surprised that one half of the registers anterior to A.D. 1600 should have disappeared. If any other nation possesses similar registers of that date (a valuable proof of uninterrupted civilization), a comparison might be instituted, and the preservation of such records through three hundred years would not prove to have been of frequent occurrence; but in point of fact examination shows that 812 English parish registers commence in the year 1538, about 40 of which contain entries (copied probably from family bibles and tombstones) anterior to the date of Cromwell's injunction; 1822 parish registers commence from A.D. 1538 to 1558, when Queen Elizabeth required a protestation from the clergy; 2448 parish registers commence from A.D. 1558 to 1603, when the canons authorized by King James directed a copy of all instant parish registers to be made and preserved, and nearly one half of them (5082) have been preserved accordingly, and are now extant. Parish registers, to the number of 969, commence between that time to the year 1650; 2757 from A.D. 1650 to 1700. 1476 parish registers from A.D. 1700 to the year 1750; the rest (six or seven hundred) since that time."

How many tombstones of these earlier dates existed in the churchyards when Mr. Rickman wrote?

Without these registers, some of the dates of the birth, marriage, and death of some of the greatest men the country has produced—Shakespeare for instance—could not be determined.

† See examples of ordinary undertakers bills in Mr. Chadwick's Report to Sir James Graham, Her Majesty's Principal Secretary of State for the Home Department. 1843. pp. 287-9.

‡ Population of Great Britain 1831. Preface to Enumeration Abstract, vol. I., p. xxix.

The registration medical officer would stand in nearly the same relation to you, who direct the inquiry into the cause of death for the purposes of registration, as the medical witness stands (under 6 & 7 Will. 4. c. 89.) to the coroner, but it might be desirable to leave his first appointment and pay to the same bodies as appoint the Registrars and Superintendent Registrars, subject to your approval, and to such rules as you may lay down as to qualification.

Sir, I submit these considerations to you with confidence, as it will be admitted generally that you have administered the present Registration Act so as to make it in its imperfect state useful as regards public health, as regards life, as regards the science of insurance, and as regards the collection of evidence affecting the transmission of names, titles, and property to successive generations. Far from justifying inaction, it is a ground for further improvement. Your great experience will give Her Majesty's Government confidence in any useful measure you suggest for rendering the national records worthy of England, and I know that it will be a satisfaction to you not only to have administered but to have perfected the law.

Satisfaction in good work was pronounced by the inventor of the word "statistics" to be characteristic of the English workman,* and I trust that I may without presumption say that while the department of which you are the chief shares the feeling, it is anxious to deserve Achenwall's praise of the English workman.

The following is an analysis of the particulars of which evidence is found in the death registers. I take the example given in the schedule :

1. That a person is dead.
2. That the name of that person is — *William Green*.
3. That the said person died at a certain date,—*at 5 o'clock, 4th February 1865*.
4. That the said person died in a certain place,—*31 Strand, London*.
5. That the said person was by profession—*a carpenter*.

Note.—All these particulars are recorded on the evidence of the informant, who, if he has witnessed the death, bears direct testimony to particulars 1, 3, 4; the testimony as to 2 and 5 may be direct or indirect. If he was merely in attendance, and has not seen the body all the evidence is indirect. He gets it at second hand.

6. That the said person was a male or a female—*Male*.
7. That the said person was of the age—*43*.

Of the *sex* and *age* the evidence is always indirect; it would be strengthened, as would all the other evidence, by the production of the certificate of birth at the time of the registry of death.

8. That the *cause of death* of said person was—*small-pox*.

Note.—Sometimes the cause of death is easily distinguished by unskilled observers; in others it can be discovered after death by a skilful inspector from the testimony of surrounding persons; in others it can only be distinguished by medical men who have observed the symptoms during life. In many obscure cases inspection of internal organs (autopsy) and chemical analysis are required to enable the medical expert to divine the cause of death. In some cases, particularly of infants and old people, the cause of death cannot be discovered in the present state of medical science.

* The Englishman is the best workman in the world, for he works so as to satisfy his own mind, and always gives his work that degree of perfection which he has once learnt to appreciate and attain; and as the Frenchman seeks to enhance the value of his manufactures by all kinds of external ornament, so the Englishman seeks to give his productions in exactitude, usefulness, and durability a less fleeting worth.†

† *Staatsverfassung der heutigen vornehmsten Europäischen Reiche und Völker im Grundriss von Gottfried Achenwall Weyland Hofrath und Professor der Rechts und der Politik zu Göttingen. 1781. (p. 324.)*

9. That the signature, description, and residence of informant was—
Rebecca Green, Widow, 17 North Street, Marylebone.
Note.—Under "Description," when *in attendance* is added, it would be well to add "nurse," "wife," "mother," &c. &c., and the profession of informant. So also when "present at death." This concludes the information; the two other columns relate to the Registrar.
10. That the Registrar registered the said particulars on a given day—
5th February.
11. Witness, his name and title, *John Cox, Registrar.*

It would tend very much to promote the accuracy of registration if every family kept a register of births, marriages, and deaths. The register in the Family Bible has often been found of great use, and the Family Register would be good corroborative evidence, although it would not, even when preserved, supersede the official register by a public officer.* I found on trial that in London many particulars respecting the great majority of the deceased, except in public institutions, are known to the people around them at death.† The following is one among many instances. It is a specimen of what I held then and still think would be a complete schedule. If it be ever adopted it will be necessary to pay the Registrar *1s. 6d.* instead of *1s. 0d.* an entry, and the Superintendent *3d.* instead of *2d.* for examination, as the labor will be increased. It is evident that the additional particulars as to birth-place, residence in district, parents' names, marriage, and issue would have the same value as some of the particulars now registered; they would depend on indirect evidence, and, if required, every year such evidence would increase in value:—

District, *Poplar.*—*William Canty, male, aged 62, died 28th February, at half past six o'clock a.m., at 16 Cottage Row, of pneumonia, 2 months, as certified by H. Bloomfield, M.D.; born in Cork, Ireland; 36 years in Poplar; father Timothy Canty, deceased, mother Mary Canty, maiden name Nicolas, deceased; married in Scrill parish, Ireland, at age 22, to Honora M'Carthy; left issue Timothy, age 31, William 30, Mary 20, John deceased, age 27 in 1846, Catherine deceased, age 1 in 1820, Stephen 21; witness, Honora Canty her x mark, widow, Informant; Mary Canty, daughter, witness; T. W. Gagen, Registrar, March 3, 1847.*

I do not venture to complicate the proposal as to the medical registration certificate with these or any other alterations of the schedule and the Act, as I know that you are better able than I am to deal with such general improvements.

To secure the registration of the causes of death it would be necessary to alter some clauses of the Act (6 & 7 W. 4. c. 86.), and to insert a new clause to the following effect. It is slightly altered from the Registration Act for Ireland (26 Vict. c. 11. s. 46.)

" Medical Certificate of Death.

" Whereas it is expedient to establish an authentic registration of the
" causes of death: Be it therefore enacted, the Registrar shall furnish from
" time to time, *gratis*, to every duly qualified medical practitioner within
" his district the necessary forms of certificates of death in the form (—)
" hereunto annexed, which certificates the Registrar General shall cause
" to be printed and forwarded from time to time to every Registrar for
" that purpose; and the medical practitioner who shall have been in
" attendance during the last illness and until the death of any person dying
" after the 31st December 1866 shall within three days after the death of

* Entries in a family Bible are admissible in evidence in matters of pedigree; they are considered to derive credit from the circumstance of their being entered in a book which is kept as the ordinary register of families, and on account of their publicity in the family. (By Lord Ellenborough, C.J., and Lord Redesdale, C., in the Berkeley Peerage Case, 4 Camp. 421; and see other authorities cited in the text books on the Law of Evidence.)

† See Journal of Statistical Society, Vol. XI., pp. 282-5.

“ such person transmit to the Registrar of the district in which the death occurred, or deliver to the relatives of the deceased, or to a person legally qualified to sign the Register as informant of the death, a certificate of the cause of death in the form mentioned, the particulars of which shall be entered by the Registrar in the register. In case such certificate shall not be so transmitted or delivered, the Registrar shall give notice of the death to the registration medical officer, who shall within two days after the receipt thereof return a certificate duly filled up to such Registrar, who shall enter the particulars relating to the cause of death in the proper column of the death register; provided that the registration medical officer shall, if he see fit, refuse to give his certificate until an inquest has been held.”

Certain amendments would be required in the Act to secure the complete registration of deaths. The task of giving notice of death to the Registrar, and in the case of deaths without medical attendance to the registration medical officer, should be enforced by penalty (see sect. 38. of 17. & 18 Vict. cap. 80., Scotch Act,) so as to make it the duty of the parties concerned to procure from the medical attendant, or in his default forthwith from the registration medical officer, the certificate of the cause of death authorizing the issue of the burial certificate by the Registrar. It is evident that if the body can be interred before the inquiry it will open a door to crime by rendering detection difficult if not impossible. The body is seen at once and is often buried in France on the second day; in England the people cling to the presence of their dead, and thus inquiry is easier. Decent dead-houses should be provided for poor families in towns.

Still-born children should be seen by the registration medical officer, whose certificate to the effect that they were still-born would authorize their burial without funeral rites. They would be entered in his books, and would not appear in the Registrar's accounts, which should embrace only all those born alive.

I. ZYMOTIC DISEASES : *Zymotici*.

The mortality by these diseases in the two years 1863-64 was much above the average of the three years preceding; it was nearly as high as in the year 1858, and the excess was chiefly due in the three years to the ravages of a great epidemic of scarlatina, coupled with diphtheria, which at its origin was confounded with malignant sore throat.

Scarlatina destroyed 20,700 lives in the year; 18,709 children under five years of age, 8,027 five and nearly ten years of age, while the remaining 2,964 were of higher ages.

Fever in its various continued forms [typhus, typhia (typhoid), and typhina (relapsing fever)] was fatal to 20,106 persons, or to 9,971 males and to 10,135 females of all ages. The rate of mortality was a little above the average, or 9.77 deaths by fever to 10,000 persons living. By estimate 165,400 persons were attacked by fever, or 79.63 in every 10,000 of the population. It will be seen that this is the chief zymotic disease which attacks young men and women in the prime of life. (See Tables VI., VII., and VIII.)

Erysipelas became more fatal in the years 1862-63-64 in the proportions of 76, 94, and 102 deaths per million of population.

II. CONSTITUTIONAL DISEASES : *Cachectici*.

These deaths are little liable to fluctuation. The decrease of deaths ascribed to dropsy, and the increase of deaths referred to cancer, in the last 15 years is probably due to the more general diffusion of medical knowledge, and to the increased proportion of certified deaths. 8117 deaths were ascribed to cancer, 7,386 to dropsy, in the last year. The total deaths from diseases of the diathetic order amounted to 17,392. The

tubercular order comprises 69,798 deaths ; 53,046 from phthisis, 5941 from tabes mesenterica, 7,700 from hydrocephalus, and 3,111 from scrofula.

III. LOCAL DISEASES : *Monorganici*.

Nearly every disease affects the whole organism directly or indirectly. But while inflammation is everywhere essentially the same pathological process, its effects in different organs where it is localized are very different. Inflammation of parts of the skin or of the limbs produces great disturbance of the functions but is not dangerous, while inflammation of the brain (cephalitis) is often fatal.

The brain diseases, including under that order all special affections of the brain, spinal marrow, and nerves, with their membranes,—these great organs of sense, volition, and motion,—killed 59,627, including 26,382 deaths, chiefly of infants from convulsions, 20,931 from apoplexy and paralysis.

22,419 persons died from affections of the heart and blood vessels.

Of all monorganic diseases those affecting the breathing organs are the most fatal ; of such affections 75,376 persons died in the year. This is an excess of 8,096 over the deaths by the same diseases in the previous year, and it is chiefly composed of deaths by bronchitis and asthma.

Phthisis and bronchitis in the chronic form are often confounded, but in phthisis there is a deposit of tubercles not only in the lungs but in other organs, and while the fatality of bronchitis is invariably influenced by a depression of temperature, the mortality by phthisis undergoes little variation. On etiological as well as pathological grounds the two diseases essentially differ, but in practice, unless their history is carefully traced, they are often confounded by persons not well skilled in diagnosis.

The deaths of this order with those by phthisis from Class II. amount to 128,422, or to more than one fourth part ($\cdot 26$) of the deaths from all causes.

The diseases of the digestive organs account for 20,969 of the deaths, including all affections of the stomach, intestines, and liver. Liver disease including jaundice counts for 8,083 in the deaths.

The diseases of other systems of organs are less fatal as their functions are distributed over an extensive apparatus which is seldom all affected at the same time, and is not in its entirety indispensable to life.

IV. DEVELOPMENTAL DISEASES : *Metamorphici*.

These diseases arise directly out of the processes of development, growth, and decay. They include malformations to which 1,297 deaths are referred, and premature birth, from undistinguished causes, either in the mother or the child. Teething is set down for 4,285 deaths.

The chief fatal causes of the class among women are 2,532 deaths from childbirth, besides 1,484 deaths of mothers from metria, often called puerperal fever. A pregnant woman is obnoxious to attacks of zymotic diseases, which is then frequently fatal ; or when labouring under some chronic disease, such as phthisis, she may become pregnant ; such deaths are referred to the fatal diseases in question. (See Table XV.) The usual mortality of mothers from childbearing is 5 deaths of mothers to every 1,000 children born alive.

29,634 deaths, chiefly of infants, are referred to atrophy and debility, the body wastes, and the forces fail without any apparent disease.

So it often is in the last stages of life, when 29,498 deaths fall from no discernible cause.

V.—VIOLENT DEATHS : *Thanatici*.

17,018 deaths are referred distinctly to external causes. The number of such deaths has increased to that number from 14,065 in the year 1855. The increase in the last two years is 2,074.

15,091 of the deaths are ascribable to accident or negligence, more or less culpable, sometimes of the victim and sometimes of third parties not amenable in the opinion of juries to criminal charges.

412 persons, including 192 infants under one year of age, died, in the opinion of coroners' juries, of homicide, either manslaughter or murder. The deaths of 110 males are murders, of 121 manslaughters; of females the proportions are very different, 138 and 43. The excess of manslaughters among males is in adults for obvious reasons.

1,340 suicides are so designated, and to these some of the 2,714 persons found drowned should probably be added. The iron regularity of the law of suicide is remarkable (see Table XIX.); but it must not be assumed that the tendency is uncontrollable.

21 criminals were executed; this is double the average number of executions in the four years 1858-61, and the increase is rather referable to the increase of murder than to any increase in the administration of the laws.

2,987 deaths by burns and scalds are recorded; 1,475 of males and 1,512 of females. The great difference in the two sexes at the ages 5-10 is due to the great inflammability of cotton dresses. It is gratifying to observe in the last year a great reduction in the mortality of both boys and girls by burns at this age. (See Table XX.)

The deaths by lightning nearly all occur out of doors, so it is not surprising that the flash struck men and women in the proportion of 5 to 1. The importance of avoiding the seduction of a shady isolated tree in a thunderstorm cannot be too much insisted on.

I have the honour to be,

Sir,

Your very obedient servant,

W. FARR.

To

The Registrar General.

TABLE I.—Excess or Defect of Annual Rate of Mortality per Cent. of Males and Females in England and Wales in the Year 1864 over or under the Mean Annual Mortality of the 27 Years 1838-64.

	AGES.—MALES.												
	ALL AGES.	0-	5-	10-	15-	25-	35-	45-	55-	65-	75-	85-	95 & upwards.
MEAN of 27 YEARS -	2·321	7·247	·830	·469	·793	·976	1·282	1·809	3·142	6·749	14·686	30·514	44·120
YEAR 1864 - - -	2·514	7·535	·993	·503	·780	1·075	1·493	1·901	3·385	7·756	15·413	34·340	53·236
EXCESS of 1864 -	·193	·288	·160	·034	·013	·097	·211	·092	·243	1·007	·727	3·826	9·116

The Table may be read thus:—The Mortality per Cent. of Males in the Year 1864, under 5 Years of Age, exceeded the Mean Mortality per Cent. of 27 Years by ·193, while, on the contrary, at the age 15 and under 25 the Mortality in the Year 1864 was less than the Mean Mortality of 27 Years by ·013; the deficiency being indicated by prefixing the minus sign thus (-·013).

	AGES.—FEMALES.												
	ALL AGES.	0-	5-	10-	15-	25-	35-	45-	55-	65-	75-	85-	95 & upwards.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

TABLE XI.—Causes of Death registered in England in each of the Ten Years 1855-1864—continued.

Class.	CAUSES OF DEATH.	1855	1856	1857	1858	1859	1860	1861	1862	1863	1864

† Up to the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line. This accounts for the changes in the table numbers.

TABLE XII.—Causes of Death in England in 1864. Proportional Numbers dying from each Class of Causes, and from each Cause.

Class.	1864		Class.	1864		Class.	1864	
	Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.		Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.		Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.

							3 Heart Disease, &c.	775'2	651'2	753'4	679'1

* The Mean Annual Mortality in the 15 years from All Causes and from Specified Causes is the mean of the three quinquennial periods and does not correspond exactly with the totals of the Orders and Classes; because under certain heads, for example, *Homicide, Suicide, and Causes not specified, &c.*, the result is derived from the deaths not of 15 years but only of portions of that period.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ Mean of 5 years.

§ Mean of 7 years.

|| Mean of 9 years.

¶ Mean of 10 years.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A, as Ashford, East.]

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 213) and "Index of certain Towns" (page 223).

A

Aberayron, 596.
 Abergavenny, 578 a.
 Aberystwith, 597.
 Abingdon, 123.
 Alcester, 405.

 Alnwick, 559.
 Alresford, 113.
 Alston, 564.
 Alton, 114.
 Altrincham, 454.
 Alverstokey, 97.
 Amersham, 148.
 Amesbury, 262.
 Ampthill, 181.
 Andover, 118.
 Anglesey, 623.
 Ashborne, 447.
 Ashby-de-la-Zouch, 414.
 Ashton-under-Lyne, 474.
 Askrigg, 537.
 Aston, 395.
 Atherham, 359.
 Atherstone, 397.
 Auckland, 542.
 Axbridge, 324.
 Axminster, 279.
 Aylesbury, 151.
 Aylisham, 232.

B

Bakewell, 449.
 Bala, 616.
 Banbury, 163.
 Bangor, 621.
 Barnet, 136.
 Barnsley, 505.
 Barnstaple, 295.
 Barrow-on-Soar, 416.
 Barton-upon-Irwell, 470.
 Basford, 438.
 Basingstoke, 116.
 Bath, 326.
 Battle, 77.
 Beaminster, 277.

Bedale, 535.
 Bedford, 179.
 Bedminster, 328.
 Bedwelty, 578 b.
 Belford, 560.
 Bellingham, 557.
 Belper, 446.
 Berkhamstead, 147.
 Bermondsey, 28.
 Berwick, 561.
 Bethnal Green, 21.
 Beverley, 518.
 Bicester, 159.
 Bideford, 297.
 Biggleswade, 180.
 Billericay, 199.
 Billesdon, 410.
 Bingham, 443.
 Birkenhead, 460 b.
 Birmingham, 394.
 Bishop Stortford, 139.
 Blaby, 411.
 Blackburn, 480.
 Blandford, 270.
 Blean, 66.
 Blofield, 237.
 Blything, 225.
 Bodmin, 304.
 Bolton, 468.
 Bootle, 572.
 Bosmere, 220.
 Boston, 425.
 Bourn, 422.
 Brackley, 164.
 Bradfield, 126.
 Bradford-on-Avon, 258.
 Bradford (Yorkshire), 499.
 Braintree, 208.
 Bramham, 514 b.
 Bramley, 500 d.
 Brampton, 566.
 Brecknock, 600.
 Brentford, 134.
 Bridge, 64.
 Bridgend, 583.
 Bridgnorth, 356.
 Bridgewater, 316.
 Bridlington, 524.
 Bridport, 278.
 Brighton, 85.
 Bristol, 329.
 Brixworth, 170.

Bromley, 49.
 Bromsgrove, 392.
 Bromyard, 350.
 Buckingham, 154.
 Builth, 599.
 Burnley, 478.
 Burton-upon-Trent, 375.
 Bury, 469.
 Bury St. Edmunds, 215.

C

Caistor, 432.
 Calne, 254.
 Camberwell, 33.
 Cambridge, 187.
 Camelford, 300.
 Canterbury, 65.
 Cardiff, 581 a.
 Cardigan, 593.
 Carlisle, 568.
 Carmarthen, 589.
 Carnarvon, 620.
 Castleford, 504 c.
 Castle Ward, 554.
 Catherington, 111.
 Caxton, 185.
 Chapel-en-le-Frith, 450.
 Chard, 318.
 Cheadle, 373.
 Chelmsford, 200.
 Chelsea, 2.
 Cheltenham, 344.
 Chepstow, 576.
 Chertsey, 38.
 Chesterfield, 448.
 Chester-le-Street, 548.
 Chesterton, 186.
 Chichester, 92.
 Chippenham, 253.
 Chipping Norton, 162.
 Chipping Sodbury, 331.
 Chorley, 481.
 Chorlton, 471.
 Christchurch, 101.
 Church Stretton, 354.
 Cirencester, 340.
 Clebury Mortimer, 355.
 Clerkenwell, 15.
 Clifton, 330.

* Thus, the number of Marriages in the Aberayron District may at once be ascertained by referring, in the "Abstract of Marriages," to the District numbered 596 (see page 24); and in like manner the number of Births and Deaths, of Deaths at different Ages, &c. will be found by referring to the same district number in the appropriate Tables.

Clitheroe, 479.
 Clun, 353.
 Clutton, 325.

	Prescot . . .	Farnworth . . .	463; 4

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S REPORT AND APPENDIX.

	PAGE
ARMY; Strength and Mortality in the Army at home and abroad	xl
AUSTRIA; Population, Marriages, Births and Deaths	xxxviii
BANK of ENGLAND refuses to accept Death Certificates	180
BILLS of MORTALITY; first commenced in London in the reign of Queen Elizabeth (1592)	176
first specified Deaths by Plague and by all other Diseases in the aggregate in 1603, and in 1629 the several Casualties were specified weekly	176
Graunt's Observations thereon, and description of the Mechanism by which the Information was obtained	176
value of them, demonstrated by Sydenham, Arbuthnot, and Heberden	177
enabled Simpson and Price to construct Life-Tables	177
similar Bills were commenced in other English and Continental Cities, but were allowed to drop	177
appear to have lost public interest when the eruptions of the Plague ceased and the returns began to be irregularly made	177
contained no information about the population of the country	177
BIRMINGHAM; no Medical Officer of Health; Vaccination greatly neglected .	lvi-lxiii
BIRTHS to a marriage	xx
fecundity of English and Scotch women	xxi
registered in 1864	xxiv
of the two Sexes; their proportions	xxv
in the four Seasons	xxvi
of Illegitimate children	xxvii
in March quarter 1864	xliv
in June " "	xlviii
in September " "	lii
in December " "	lx
BIRTH-RATE in different parts of the Country	xxiv
BLACKBURN; 300 persons attacked with Typhus in Sub-district of Oswaldtwistle in December quarter 1864	lxiv
BORDER-MARRIAGES	vii-viii
BRONCHITIS AND ASTHMA excessively fatal in 1864	192
BRONCHITIS AND SCARLATINA the chief causes of the excess in the rate of Mortality in 1864	175
BURIALS; Abstracts of Registers ordained in each Parish in the Reign of Queen Elizabeth	176
are publicly registered, but there is no identification of the Body, so in a large City anybody may be buried under any Name	178

BURIALS— <i>continued.</i>	PAGE
the Code Napoleon requires the Registrar (<i>Officier de l'état civil</i>) to see the body, and no interment can take place without his Certificate	178
prohibition of interment without Registrar's Certificate would obviate many evils in England	182
BURNS AND SCALDS; reduction in the mortality	193
CAUSES OF DEATH; Letter thereupon from William Farr, M.D., to the Registrar General	175
CAUSES OF DEATH; Registration of. (<i>See REGISTRATION OF DEATHS.</i>)	
CERTIFIED and UNCERTIFIED Deaths; their proportions in 1858 have since undergone no essential change	175
CERTIFIED and UNCERTIFIED Deaths; London has the largest proportion of certified deaths and Yorkshire and Wales the least	175
CHILDREN BORN OUT OF WEDLOCK. (<i>See also BIRTHS.</i>)	xxvii
CONSTITUTIONAL DISEASES; little liable to fluctuation save in names, and this is accounted for by the more general diffusion of medical knowledge	191
CORONER'S INQUIRY; a protection to life, and oftentimes relieves the innocent from suspicion	176
improvement in the Coroners' returns	177
nature and limitation of the Inquiry	178
cost of Inquiry	187
COTTON FAMINE; Relief operations in the distressed Districts in March quarter 1864	xlv
DEAD-HOUSES; decent ones should be provided for poor families in towns	191
DEATHS registered in 1864	xxviii
DEATHS, registration of. (<i>See REGISTRATION OF DEATHS.</i>)	
DEATHS and STATE of the PUBLIC HEALTH in March quarter 1864	xlv
in June " "	xlix
in September " "	liii
in December " "	lxii
DEATH-RATE above the average. (<i>See also MORTALITY.</i>)	xxviii
DEVELOPMENTAL DISEASES; the chief fatal causes of the class are diseases consequent upon pregnancy and childbirth	192
DISTRICTS; changes in the constitution of, during 1864	172
index to	209-212
EDUCATION; advantages of the Scotch system of	xviii
EMIGRATION in 1864	ii
in March quarter 1864	xliv
in June " "	xlvi
in September, " "	lii
in December " "	lx
ERYSIPELAS	191
ESSEX POISONINGS (1848); undetected in consequence of imperfect Registration	181
EXECUTIONS; increase referable rather to increase of murder than to increased rigour of the law	193
FAMILY REGISTERS; very useful as corroborative evidence in support of the official Registers	190

	PAGE
FARR, WILLIAM, M.D.; Letter to the Registrar-General on the Causes of Death	175
FECUNDITY of English and Scotch women	xxi
FEVER	191
FRANCE; Regulations concerning Marriage	x
Population, Marriages, Births, and Deaths	xxxvi
the Code Napoleon requires the Registrar to see the Body before he registers the Death	178
Female informants are rejected	186
FUNERALS; cost of, amongst different Classes	187
GLENDALE; a model District for low Rate of Mortality, but the Village of Lowick is in bad sanitary condition, and suffers heavily from Fever	lvi
GRAUNT, JOHN; Observations on the London Bills of Mortality, and description of the mechanism by which the information was obtained	176
GRAVESTONES; cost of	188
endurance of	188
GREAT BRITAIN; Population, Marriages, Births, and Deaths	xxxv
GHETNA GREEN Marriages	vii-viii
ILLEGITIMATE BIRTHS; proportion in different Counties. (<i>See also</i> BIRTHS.)	xxviii
INFORMANTS for Registration purposes, no restriction as to capacity, character, sex, or age	178
their qualifications	178
sex and capacity of, in certain Districts	179
no check on veracity of	180
instances where there is no legally qualified Informant	182
the French refuse Female Informants	186
majority of Informants in many Districts are ignorant women who sign the Registers with Marks; numbers and proportions of such Informants	186
INSPECTORS; suggested appointment of two additional Registration Inspectors to look after the Registration of Causes of Death, and the facts of cases where Informants sign the Register with Marks	185
ITALY; Population, Marriages, Births, and Deaths	xxxviii
LANCASHIRE; "The high Death-rate prevailing in Lancashire Towns has its main cause in the foul cottage cesspit." (Mr. Rawlinson's Report.)	xlvii
LEGITIMATION <i>per subsequens matrimonium</i> admitted in almost every European nation save England; the English law the wisest	xxii
LIGHTNING, Deaths of Men and Women in the proportion of 5 to 1	193
LIVERPOOL; prevalence of Typhus, Small-pox, Diarrhoea, and Scarlatina in December quarter 1864	lxiii
fictitious entries in Registers of Howard-street Sub-district (<i>see</i> 18th Annual Report, p. 394)	180
LOCAL DISEASES; different effect of disease in different organs	192
Phthisis and Chronic Bronchitis often confounded; the difference between them	192

	PAGE
LONDON ; Health of, in 1864	lxiv
Area and distribution of people in North and South Districts in 1864	lxiv-lxvi
proportions of the two Sexes in Births and Deaths in 1864	lxiv
excessive Death-rate in January 1864	lxv
prevalence of Typhus in 1864	lxvi-lxviii
fatality of Typhus in London, Liverpool, and Manchester	lxvii
its atmosphere of smoke and fog ; its " mud-oceans "	lxvii-lxviii
 MARRIAGE ; a public ceremony	 ii
regulations as to presence of Registration Officers at the ceremony	ii
interval between giving Notice and the time of Marriage	iii
by Superintendent Registrar's Licence and Certificate may take place either in a Register Office or in a registered place of Worship	iv
in Superintendent Registrar's Offices ; Districts in which they were most numerous	v
in Superintendent Registrar's Office ; sudden increase in Carlisle in 1857, consequent on passing of Act (19 & 20 Vict. c. 96.) stopping irregular Marriages	v-vii
at Gretna Green ; reference to 13th Report (pp. vii-viii) wherein the evils of the system are adverted to	vii
at Gretna Green and on the Border ; number of entries on Registers	vii
at Gretna Green and on the Border ; Letter from Mr. Robert Forster of Longtown (8th March 1866) as to entries in Registers	viii
by Banns ; objection to, in Cumberland and other Counties	viii
in Superintendent Registrars' Offices are in many cases not withdrawn from the Registers of the Established Church or from the Chapels of Nonconformity, but from the ranks of immorality	viii
by Banns ; publication is often very useful, but in large Cities is often inefficiently performed	x
by Licence ; the Licence has descended from the age of " indulgences " (25 Hen. 8. c. 21.)	x
by Licence ; the fee on a Licence a kind of fine for omitting usually recognized precautions	x
by Licence unknown in Scotland ; how regular Marriages may be solemnized	x
regulations for Marriage in France	x
fees for " cheap " Marriages about 12s., and for " dear " Marriages about 64s. ; numbers married under the two classes	x
solemnized with and without religious rites by different Denominations	xi
covenants of Marriage in Anglo Saxon times, and subsequently	xi-xiii
Act of Lord Hardwick (1752) made Church-Rites indispensable	xii
Act of 1837 gave freedom of Marriage to Nonconformists	xiii
relation between Price of Wheat and Marriages of higher and lower classes	xiii
coincidence between the proportions of Marriages by Licence and the proportion of the Population living in Houses of the rent of 20l. and upwards in England and Wales	xiii
high Prices of Wheat depress Marriage among those who marry by Banns and Certificate, but the effect on the Licences is rather the reverse	xiv
proportion of Marriages of different Denominations in Scotland	xiv

MARRIAGE— <i>continued.</i>	PAGE
of Roman Catholics would appear to show that the numbers of that Body in the United Kingdom are below the usual estimate	xiv
difference in circumstances constituting validity of Marriage in England and Scotland	xiv
less frequent in Scotland than in England	xiv
vary amongst different classes in different seasons	xiv
greatest proportion of Marriages on Sunday and Monday	xv
of Widowers and Widows	xv
of Minors	xvi
signatures of Registers a test of educational progress	xvi
fruitfulness of Marriage in England and Scotland	xx
irregular cohabitation of lower classes common in Scotland, and results frequently in Marriage if children are born; this encouraged by legitimation of pre-nuptial children	xxiii
in March quarter 1864	xliv
in June " "	xlvii

RAINFALL; very defective in September quarter 1864; great scarcity of water in many places so that it sold for 1d. to 3d. per bucket	liii
REGISTERS AND SEARCHES; number of Names on Registers, and number of Searches	xliii
REGISTRATION; progress of, in 1864	i
REGISTRATION OF DEATHS IN ENGLAND :	
proportion of certified and uncertified Deaths which obtained in 1858, have undergone no essential change	175
the largest proportion of certified Deaths in London, and the smallest in Wales and Yorkshire	175
Causes of Death, two kinds of imperfection in the registration of, (1) due to the imperfection of medical science, and (2) to the imperfect practical application of existing science	175
medical attendance of the population very deficient, yet it is believed to be better than that of any other State of Europe	175
thousands of Deaths occur without any scientific inquiry as to the cause	176
Coroners inquiry, a protection to life, and oftentimes relieves the innocent from suspicion	176
Causes of Death inquired into in the earliest dawn of English society, with a view to discovery and prevention	176
plagues of the 16th century gave rise to the London bills of mortality	176
Abstracts of registers of burials, baptisms, and marriages in each parish established in the reign of Queen Elizabeth	176

REGISTRATION—continued.

	PAGE
still-born, unregistered	182
many evils would be obviated by forbidding the burial of any body without the Registrar's Certificate	182
instances where there is no legally qualified Informant for Registration	182
present cost of Registration	182
an extension of the system of Medical Certificates would remedy the prevailing defects	182
certificates of medical attendants should still be received, <i>provided they have seen the deceased on the day of death, or have seen the body subsequently for identification</i>	182
a Registration Medical Officer should be appointed in every District whose duty it would be to investigate all cases of uncertified Deaths	183
new Forms of Medical Certificate	183-184
under this new arrangement every body would be identified before burial, life would become more secure, frauds of Registrars and mistakes of Informants would be less common, and the certified copy of an entry would not be, as at present, imperfect evidence of Death	184
the Registration Medical Officer would be found a most useful functionary all over the country, and might with advantage be appointed the Health Officer of his District	185
Advisability of appointing an Inspector to make periodical inquiries into the actual facts of cases where Informants sign the Register with Marks, and also a Medical Inspector to look after the Registration of Causes of Death generally	185
the Registration Medical Officer not to supersede the family physician in certifying the cause of death	186
the French principle of refusing Female Informants inapplicable to England	186
Majority of Informants in many Districts are ignorant women who sign the Registers with Marks; numbers and proportions of such Informants	186
cost of improved system of Registration as compared with present system	187
cost of Coroners' Inquiries	187
cost of Funerals of different classes	187
cost of Gravestones	188
endurance of Gravestones and of Registers	188
antiquity of Parish Registers	188
testimony in favour of English work and workmen by Professor Achenwall	189
analysis of particulars of which evidence is found in the Death Registers	189
Family Registers of Births, Marriages, and Deaths very useful as corroborative evidence of the Official Registers	190
instance of particulars required to make a complete public Register proposed Clauses relating to Medical Certificate of Death, &c.	190
decent dead-houses should be provided for poor families in Towns	191
still-born children should be seen by the Registration Medical Officer, whose Certificate would authorize their burial without funeral rites; they should be entered in his books, and not in the Registers, which should embrace all those born alive	191
REGISTRATION MEDICAL OFFICER; suggested appointment of	183
his duties	183-184
not to supersede the family physician in certifying the cause of death	186

	PAGE
RE-MARRIAGES	xv
ROMAN CATHOLICS; if the marriage returns of Ireland are complete the number of Catholics in the United Kingdom would appear to be below the usual estimate	xiv
SCARLATINA; very prevalent throughout the southern districts of the country in September quarter 1864	lv
deaths from, in 1864	191
SCARLATINA AND BRONCHITIS; the chief causes of the excess in the rate of mortality in 1864	175
SCOTLAND; marriages by licence unknown; how regular marriages may be solemnized	x
proportion of marriages in different religious denominations	xiv
difference in circumstances constituting validity of marriage in Scotland and England	xiv
marriage less frequent than in England	xiv
larger proportion write their names than in England	xvii
advantages of the Scotch system of Education	xviii
fruitfulness of marriage in	xx
fecundity of Scotch and English women	xxi
irregular cohabitation of lower classes is common, and results frequently in marriage if children are born	xxiii
SEA; Births and Deaths of British Subjects at	xli
Mortality of Merchant Seamen at Sea	xli
SEARCHES; number of	xliii
SEASONS AND METEOROLOGY; influence of, on Public Health	xxxiii
SIGNATURE OF MARRIAGE REGISTERS	xiv
in Scotland; larger proportion write their names than in England	xvi
SOUTH SHIELDS; fictitious entries in Registers (<i>see</i> 9th Annual Report, p. 239)	180
SPAIN; Population, Births, and Deaths	xxxix
STILL BORN; 521 interments of <i>reported</i> still-born children in All Saints Cemetery at Newcastle-upon-Tyne within 7 Years	lviii
not registered at all, and are buried with little difficulty	182
should be seen by the Registration Medical Officer, whose Certificate should authorize their Burial without funeral rites; they should be entered in his books, and not in the Registers, which should embrace all those born alive	191
SUB-DISTRICTS; index to	213-222
SUICIDE; remarkable regularity of the law of occurrence	193
TOWN AND COUNTRY DISTRICTS, rate of mortality	xxix
TOWNS; index to certain Towns whose names differ from that of the District and Sub-district in which they are respectively situated	223
ULVERSTON; once a very healthy district, but with increased prosperity has now a high death-rate	l
VIOLENT DEATHS; increase in the number since 1855	192
Murder and Manslaughter	193
Suicides, remarkable regularity of the law of their occurrence	193

VIOLENT DEATHS— <i>continued.</i>	PAGE
Executions, increase referable rather to increase of murder than to increased rigour of the law	193
Burns and Scalds, reduction of mortality	193
Lightning; deaths of men and women by, in the proportion of 5 to 1	193
 WATERING PLACES in England; generally on good sites, but in many cases defective drainage nullifies that advantage	 li
 YORKSHIRE; increase in rate of Mortality in June quarter 1864	 1
 ZYMOTIC DISEASES; mortality by these Diseases in the two years 1863-64 much above the average of the three years preceding	 191
Scarlatina	191
Fever	191
Erysipelas	191

TABLES AND ABSTRACTS IN REPORT AND
APPENDIX.

	PAGE
AGES of 234,880 Persons married in 1864, distinguishing Bachelors, Spinsters, Widowers, Widows	26-27
Deaths of Males and Females at different Ages registered in 1864 in Divisions, Counties, and Districts	98-119
Causes of Death of Males and Females in England at different periods of Life, in 1864	120-125
Supplementary Table of Causes of Death of Males and Females in England at different periods of Life, in 1864	126-129
Causes of Death of Males and Females in London, at different periods of Life, in 1864	130-135
ARMY ; Annual Rate of Mortality per cent. in Great Britain, England, France, and Austria and Italy, including the Deaths of Soldiers at Home and Abroad, 1857-64. (Table XXVII.)	xxxviii
Average Strength of the British Army Abroad in each of the Years 1861-64. (Table XXVIII.)	xxxviii
Number of Deaths in the British Army at Home and Abroad, 1861-64. (Table XXX.)	xxxix
Annual Rate of Mortality per cent. amongst Officers and Men in the Army Abroad, 1858-64. (Table XXXI.)	xxxix
Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table XXXII.)	xl
Deaths in Army Abroad of Officers and Men belonging to England and Wales and to Great Britain, 1858-64. (Table XXXIII.)	xl
AUSTRIA ; Estimated Population in middle of the Years 1853-64. (Table XXIV.)	xxxvi
Number, and Proportion per cent. to Population, of Marriages, Births, and Deaths, in each of the Years 1853-64. (Table XXV.)	xxxvii
Annual Rate of Mortality per cent. in the Austrian Army, 1857-64. (Table XXXIV.)	xl
BIRTHS registered in England, in each Year, 1838-1864. (Table I.)	i
Proportion to Population in each Year, 1838-64. (Table II.)	ii
Legitimate and Illegitimate ; registered in each Year 1856-60 in England. (Table VIII.f.)	xviii
Legitimate and Illegitimate ; registered in each Year 1856-60 in Scotland. (Table VIII.f.)	xviii
Legitimate and Illegitimate in England in the Years 1845-64. (Table IX.)	xxiv
in Counties, in 1864. Numbers, Legitimate and Illegitimate, of the two Sexes ; Proportions of Male to Female Births, Legitimate and Illegitimate ; Proportion of Illegitimate Births to Total Births. (Table X.)	xxv
Proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838-64. (Table XII.)	xxvii

	PAGE
BIRTHS — <i>continued</i> .	
registered in England in each Quarter of the Years 1838-64. (Table XIII.)	xxvii
registered in each of the Divisions, Counties, Districts, and Sub- districts in 1864	28-82
Excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1864	28-82
registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1864	86-89
of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1864	90-93
BIRTH-RATE in Counties in each of the Years 1854-64. (Table XI.)	xxvi
in each Quarter of the Years 1838-64. (Table XXI.)	xxxv
BURNS AND SCALDS ; Deaths and Mortality at different Ages, in the Years 1848-64. (Table XX.—App.)	208
CAUSES OF DEATH of Males and Females in England, at different Periods of Life, in 1864	120-125
Supplementary Table of Causes of Death of Males and Females in England at different Periods of Life, in 1864	126-129
Causes of Death of Males and Females in London at different Periods of Life, in 1864	130-135
Causes of Death of Males and Females in England, and in each of the Divisions and Counties, in 1864	136-159
Deaths from several Causes in 1864, in the Divisions, Counties, and Districts of England	160-171
registered in England in each of the Ten Years 1855-64. (Table XI.—App.)	198-200
Proportional Numbers dying from each Cause in 1864. (Table XII. App.)	201
Mean Annual Rate of Mortality from different Causes during 15 Years, 1850-64. (Table XIII.—App.)	202-203
in England, in 1864, arranged in the order of Mortality. (Table XIV. App.)	204
CHILDBIRTH ; Deaths in 1864, at different Ages, of Women after Child- bearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table XV.— App.)	205
Deaths of Women from Metria and Childbirth in the 18 Years, 1847-64, and proportional Deaths of Mothers to Children born alive. (Table XVI.—App.)	206
CYNANCHE MALIGNA and DIPHTHERIA ; Deaths in England at different Ages in each of the 10 Years, 1855-64 (Tables II. and III. App.)	194
DEATHS registered in England in each Year, 1838-1864. (Table I.)	i
Proportion to Population in each Year, 1838-64. (Table II.)	ii
registered in England in each Quarter of the Years, 1838-64. (Table XIII.)	xxvii
Proportional Number in each Quarter to 1,000 Deaths in the average Quarter, 1838-64. (Table XX.)	xxxiv
registered in each of the Divisions, Counties, Districts, and Sub- districts in 1864	28-82
in 1864 in the principal Public Institutions in London	83-84
registered in each of the Four Quarters of 1864 (distinguishing Males and Females), in Divisions and Counties	94-97
of Males and Females at different Ages registered in 1864 in Divisions, Counties, and Districts	98-119

	PAGE
DEATHS FROM DIFFERENT CAUSES (<i>See</i> CAUSES OF DEATH).	
DEATH-RATE of Males and Females in each of the Years 1838-64. Table (XIV.)	xxviii
